

REACTORS

Incorporated transformers

- ➔ Single-phase transformers up to 630 kVA
- ➔ Three-phase transformers up to 1000 kVA
- ➔ Control transformers
- ➔ Safety isolating transformers
- ➔ Isolating transformers for installation in hospitals
- ➔ Insulating transformers up to 10000 V
- ➔ High current transformers up to 2000 A
- ➔ Autotransformers - starting transformers
- ➔ Variable voltage transformers for ventilation systems
- ➔ Transformers for vehicles
- ➔ Print and flat transformers
- ➔ Transformers for switched-mode power supplies

Ballasts for lighting equipment

- ➔ Special ballasts for gas discharge lamps up to 100 kW
- ➔ High-reactance transformers
- ➔ Controlled ballasts (transducers)
- ➔ Electronic ballasts up to 30 kW

Resin-encapsulated transformers

- ➔ Safety isolating transformers, stationary/portable
- ➔ Isolating transformers, stationary/portable
- ➔ Roof inlet transformers
- ➔ Thawing transformers
- ➔ Antifreeze transformers
- ➔ Print and flat transformers

Voltage stabilizers

- ➔ Incorporated versions up to 3000 VA
- ➔ Portable versions up to 1000 VA

DC power supplies

- ➔ Single-phase types - unsmoothed, up to 1000 A
- ➔ Single-phase types - with C/LC smoothing, up to 1000 A
- ➔ Three-phase versions up to 1000 A
- ➔ Smoothed DC power supplies

Reactors and inductors

- ➔ AC reactors up to 320 kVA, single-phase
- ➔ AC reactors up to 500 kVA, three-phase
- ➔ DC reactors up to $L^2 = 1500$ Ws
- ➔ Filter reactors - AF rejector circuits
- ➔ Transducers - reactors for switched-mode power supplies

voltage made to measure

→ We warrant the safe and proper function of our transformers and inductive components for a period of up to five years.

→ The people behind SBA are the basis of our success. Custom design of solutions requires a high degree of flexibility and customer focus. The best solution to a customer's problem is always developed in a team effort. The result is the optimal design for every product. Computer-backed processes, attractive prices and high-level logistics are ideal complements of the advanced know-how of our employees. Independent, responsible action is as important as creative thinking to meet our customers' requirement profiles.

➔ SBA - an Investment in the future.

Permanent innovation and most advanced materials guarantee and constantly redefine the high quality of SBA transformers and power supplies. The heat resistant materials from SBA meet highest demands on safety, life and quality - VDE and TÜV approved. Extensive controls in all areas of production warrant the reliability of all SBA products.

➔ Every day, new proof of SBA's performance potential is provided: Products of special design in small or medium lots permit individual solutions for diverse applications in industry - often within a few working days. SBA - with strong technology and mature products into the future.

FOR many industries

➔ Voltage stabilizers

- magnetic up to 3 kVA
- motor-controlled up to 1000 kVA

➔ DC power supplies

- non-stabilized up to 1000 A
- stabilized up to 40 A
- UPS modules for DC power supplies

➔ Resin-encapsulated transformers

- Safety isolating transformers (including portable versions)
- Isolating transformers (including portable versions)
- Print and flat transformers

S

➔ Ring core and variable toroidal transformers

- Ring core transformers
- Variable toroidal transformers, single-phase or three-phase

➔ Reactors and inductors

- AC reactors up to 500 kVar
- DC reactors
- Line reactors and commutating reactors
- Filter reactors - AF rejector circuits
- Switched-mode power supply components

➔ Incorporated transformers

- Single-phase transformers up to 630 kVA
- Three-phase transformers up to 1000 kVA
- Isolating transformers for installation in medical equipment room
- Insulating transformers up to 10000 V
- High current transformers up to 2000 A
- Auto transformers
- Transformers for rail vehicles

➔ Ballasts for lighting equipment

- Special ballasts for all kinds of gas discharge lamp up to 100 kW
- High-reactance transformers
- Controlled ballasts (transductors)
- Electronic ballasts up to 30 kW

Type DGE

Single-phase smoothing reactor to EN 61558-2-20 / VDE 0570-2-20

Application

To reduce the ripple in DC circuits, e.g., of controlled power converters. This reduces the noise and heat of connected motors and also reduces motor loss.

Reduces commutator wear and thereby extends the useful life.

Parallel operation of phase-displaced power converters is possible by suppression of compensating current.

Customized specification and dimensions ensure optimal application.

TYP DGE SINGLE-PHASE SMOOTHING REACTORS

Construction

- ⇒ Open construction (IP 00, incorporation up to max. IP 23)
- ⇒ Required space according to DIN 41308
- ⇒ Depending on rated current: screw terminals or flat termination with bolt
- ⇒ Very low-noise due to special core assembly and high-grade vacuum impregnation in black polyester impregnating resin
- ⇒ Wear-resistant, heat, UV and solvent resistant nameplate
- ⇒ **Special versions** available on request

Type DNE

Single-phase line reactor to EN 61558-2-20 / VDE 0570-2-20

Application

Reactor limiting peak current, suppressing reactions on system and commutation notches. Harmonics are substantially dampened. As discharge reactor for capacitors in compensation systems. As neutral grounding reactor to reduce neutral conductor currents in local three-phase systems. As series reactor for current limitation in discharge lamps. Customized specification and dimensions ensure optimal application.

Type DKE

short circuit voltage at 4% to mains (230 V)

Single-phase commutating reactor to EN 61558-2-20 / VDE 0570-2-20

Application

As commutating reactor to limit peak current, suppress reactions on system and commutation notches. Harmonics are substantially dampened.

Due to the selected reactor inductance, the short-circuit voltage matches the connected consumer, with this product: short circuit voltage at 4% to mains.

Type DKE

short circuit voltage at 4% to mains (400 V)

Single-phase commutating reactor to EN 61558-2-20 / VDE 0570-2-20

Application

As commutating reactor to limit peak current, suppress reactions on system and commutation notches. Harmonics are substantially dampened. Due to the selected reactor inductance, the short-circuit voltage matches the connected consumer, with this product: short circuit voltage at 4% to mains.

SINGLE-PHASE COMMUTATING REACTORS

Construction

- ➔ Open construction (IP 00, incorporation up to max. IP 23)
- ➔ Required space according to DIN 41308
- ➔ screw terminals
- ➔ Very low-noise due to special core assembly and high-grade vacuum impregnation in black polyester impregnating resin
- ➔ Wear-resistant, heat, UV and solvent resistant nameplate
- ➔ **Special versions** available on request

Specifications

Supply voltage	max.	400 V
Rated current	max.	50 A
Frequency		50-60 Hz
Protection class		I
Protection index		IP 00
Insulation class		B
Ambient temperature	max.	40° C

Overview

400 V three-phase system between 2 phases / corresponds to short circuit voltage at 4%, voltage drop of 16 V at I_N

Type DZE

Single-phase link reactor to EN 61558-2-20 / VDE 0570-2-20

Application

The single-phase link reactor is intended for installation in the DC circuit of frequency converters. This reduces the harmonics component and improves the efficiency. It avoids system asymmetry at the input side of power system managed converters and the output side of self-commutated inverters for speed control. This improves the smooth running of drives and extends their life. The linear nature of the reaction parameters far beyond the rated current range ensures safe function also in limit areas. As loss is reduced and the efficiency of drives improved, less energy is consumed and the system environment minded.

Type DND

Three-phase line reactor to EN 61558-2-20 / VDE 0570-2-20

Application

As series reactor limiting peak current, suppressing reactions on system and commutation notches. Harmonics are substantially dampened. The use as motor reactor in converter service ensures reduction of the flank steepness and therefore less motor wear and running noise. The use of individual reactors is possible. The selection of the reactor's inductance enables current limitation to be adapted to the requirements with low loss.

TYPE DKO THREE-PHASE COMMUTATING REACTORS

Construction

- ➔ Open construction (IP 00, incorporation up to max. IP 23)
- ➔ Resting on angular feet (DIN 41307)
- ➔ Depending on rated current: screw terminals or flat termination with bolt
- ➔ Very low-noise due to special core assembly and high-grade vacuum impregnation in black polyester impregnating resin
- ➔ Wear-resistant, heat, UV and solvent resistant nameplate
- ➔ **Special versions** available on request

Specifications

Output range	max.	160 kVAr
Supply voltage		3 x 400 V
Rated current	max.	1000 A
Frequency		50-60 Hz
Short-circuit voltage		$U_K = 2\%$ (4.6 V)
Protection class		I
Protection index		IP 00
Insulation class		B/F
Ambient temperature	max.	40° C

Overview

3 x 400 V three-phase system / corresponds to short circuit voltage at 2%, voltage drop of 4.6 V at I_N

Type DFD

Vertical version

Three-phase filter reactor to EN 61558-2-20 / VDE 0570-2-20

Application

Use in reactive current compensation systems for defined elimination of harmonics. Connected in series with capacitors, the reactor can be matched optimally to the conditions of the system, depending on the dominating harmonics. The impedance characteristics of the system improve. Filter reactors prevent loss due to capacitor overload.

General technical information

Reactors are electromagnetic components which due to the wide variability of their technical parameters can be used in many DC and AC applications. They act as energy storage mechanism, current limiter, system quality improver and suppressor of energy-rich harmonic components and their reactions on the supplying system. High-grade core materials ensure low-loss operation and long life of all reactors.

Vacuum impregnation in high-quality resin is standard and reduces the noise caused by the extremely short remagnetizing processes. Any customized product which is not part of our standard range can be made in high quality and within short time. We have all required computer programs to translate the customer's specifications into the required production documents. Commonly, reactors can stand brief high overload as indicated in the table but will need a sufficiently long period to cool down after this.

DC smoothing reactors reduce ripple in the DC circuits of current converters. Smoothing reactors can "fill" energy gaps by supplying the magnetic energy they store. A connected motor drive will run smoother and at lower loss and also with less noise.

System reactors of which single-phase and three-phase versions are available, are mostly needed in AC environments. Used as series reactor, they help achieve a defined current limitation at relatively low loss. As motor reactor, reactions on the system are mitigated and commutation notches as well as harmonic content dampened significantly. To ensure optimal function of a system, the inductance of a system reactor must usually be adapted to the purpose for which it is used. Special versions of system reactors include discharge reactors for the rapid transfer of voltage to compensation capacitors, and neutral grounding reactors for integration in separate TN systems.

Commutating reactors are available as single-phase or three-phase version. Commutation is the term to describe an extremely sudden current transition between the different power valves and current power converters. A short-circuit condition would occur for the brief time of overlap. Due to its inductance, a series-connected commutating reactor reduces the rate at which the current rises and thereby prevents these brief system notches. According to VDE 0160, the input-side short-circuit voltage should at least be 4%, and on this basis a series with $u_k=4\%$ is available for the standard voltages. If in addition an autotransformer with the common $u_k=4\%$ should be connected in series, a series with $u_k=2\%$ is also made.

Link reactors are generally used in the DC circuit of frequency converters, where they suppress commutation notches. A link reactor consists of two identical windings on a common core with magnetic coupling. All parameters, such as inductance, linearity or operating current, very much depend on the specific conditions in which the reactors are used. Due to the high currents involved, line reactor connections are in most cases made with marked solid copper terminal leads.

Filter reactors are used in compensation systems in combination with capacitors for reactive-power compensation. Reactive power from inductive consumers, such as motors, fluorescent lamps, etc., put a reactive power load on the supplying systems which oscillates between the consumer and the energy supplier for no purpose and causes additional line loss with all known negative effects. The local compensation of such current portions saves cost and also improves the quality of the system by eliminating undesired current harmonics, provided the right type of reactor is installed. Filter reactors are available in a series from 2.5 kVAR to 75 kVAR with different chokes.

Special-purpose reactors are generally made to customer specifications. They include ring core reactors, interference suppression coils and energy storage reactors mostly of small size and high-quality full resin encapsulation. Line reactors for gas discharge lamps are made in the output range of up to 100 kW. Current dividing reactors, mostly in generator-fed systems, avoid generator overload.

General technical information

Important technical terms will be explained in the following passages. Depending on the proposed use, additional or different definitions may be required. The following explanations are therefore not exhaustive..

Connection symbols

Reactors from SBA are single-phase in IO or IIO and three-phase in IIIO.

Laws and regulations

Unless required otherwise, we make our transformers to reflect state-of-the art and comply with the following laws and regulations:

DIN EN 61558-2-20 / VDE 0570 part 2-20 / 04.01 / IEC 61558-2-20
 DIN EN 61558-1 / VDE 0570 part 1 / 07.98 / IEC 61558-1

Insulation classes

The provisions of IEC 60085 and IEC 60216 describe the heat resistance if insulation classes.

Insulation class	Highest permitted temperature at rated service conditions
A	105 °C
E	120 °C
B	130 °C
F	155 °C
H	180 °C

Reduction factor (f)

The reduction factor, f, indicates the possible reduction of the size in comparison with continual service.

DR	%	100	80	70	60	50	40	30	20	15	10
f		1	0,89	0,84	0,77	0,71	0,63	0,55	0,45	0,39	0,35

Protection class

The protection class is a design feature of a product which designates safety against shock current.

Protection class I: Product with safety ground terminal and basic insulation

Protection class II: Product without safety ground terminal and double or extra strong insulation.

Operating mode

The output ratings and rated currents in this catalog are for continuous service.

Required space

DIN standard 41307 applies to the uniform screw-on size and fastening brackets.

Duty ratio, DR

The duty ratio (DR) of a transformer is the ratio between load time and cycle duration. Unless specified otherwise, the cycle duration is 10 min.

$$DR = \frac{t_{on}}{t_{on} + t_{off}} \times 100\%$$

Current norms and glossary of terms

Short time operation

If the load in continuous service is smaller than the rated output, the reactor can be overloaded for short periods provided it does not heat to more than the permitted overtemperature.

Previous continuous load in % of rated output	Permitted duration (in minutes) of load in % of the rated output				
	150%	140%	130%	120%	110%
50	25	30	40	50	80
60	20	25	30	40	65
70	15	20	25	30	50
80	10	15	20	23	35
90	5	10	15	15	20

Overload-resistant reactor:

This is a reactor in which the temperature does not exceed the defined limits when the reactor is under overload and which when the overload ends continues to meet all requirements of the applicable norm.

Non-inherently overload-resistant reactor

This is an overload-resistant reactor which is equipped with a protection mechanism that opens the electric circuit or reduces the current in the circuit when the reactor is overloaded and which when the overload is removed or the protection mechanism reset or replaced and continues to meet all requirements of the applicable norm.

Inherently overload-resistant reactor

This is a reactor without a protection mechanism in which the temperature due to the construction of the reactor does not exceed the defined limit when the reactor is under overload and which after the overload is removed continues to function and to meet all requirements of the applicable norm.

Reactor without overload resistance

This is a reactor which it is protected against exceedingly high temperature by a protection mechanism that is not integrated in the reactor and which when the overload is removed or the protection mechanism reset or replaced continues to meet all requirements of the applicable norm.

Fail-safe reactors

A reactor which when not used to as intended permanently drops out by interrupting the defective circuit and which is not a danger for the user or the environment.

Reactor

An apparatus consisting of one or several windings with frequency-depending impedance and working on the principle of self-induction, in which a magnetized current generates a magnetic field that passes through a magnetically active core or through air.

AC reactor

A reactor in which the magnetized current generates an magnetic alternating field whose polarity changes as a function of the frequency.

Premagnetized reactor

A reactor in which the magnetizing direct current generates a magnetic field of single polarity while a superimposed alternating current changes the magnetic field as a function of amperage and frequency

Current norms and glossary of terms

The protection type marking consists of a code of two constant letters, viz. „IP“ and two digits, e.g., IP23.

First digit	Protection	
	Description	Explanation
0	No protection	No protection against contact of live parts
2	Protection against medium-size foreign objects	Protection against contact of live parts by fingers Protection against entry of foreign objects greater than 12 mm
4	Protection against granular foreign objects	Protection against contact of live parts by fingers with tools, wires or the like of more than 1 mm thickness
5	Protection against deposits of dust	Complete protection against contact with live parts. Protection against harmful dust deposits. The penetration of dust is not completely prevented but the dust must not affect operation.
6	Protection against penetration of dust	Complete protection against contact with live parts. Protection against penetration of dust

Second digit	Protection	
	Description	Explanation
0	No protection	No protection available
1	Protection against drops of water falling vertically	Drops of water falling vertically shall have no harmful effect
3	Protection against spray water	Water falling from any angle less than 60 degrees from vertical shall have no harmful effect.
4	Protection against splash water	Water splashing from any direction shall have no harmful effect
5	Protection against water jets	A jet of water from a nozzle directed at the transformer from any direction shall have no harmful effect
6	Protection against flooding	No harmful amount of water to which the transformer is exposed during a temporary flooding must enter.
7	Protection against immersion... (atm(g))	If the transformer is immersed in water under specified pressure and time, no harmful amounts of water must enter the transformer

Sample applications

DGE single-phase smoothing reactor

Advantages if used as **armature reactor**

- Less running noise
- Less wear
- Reduced motor loss
- Limitation of starting current

Special reactor

Advantages if used as **gap reactor**

- Current pulses with mainly ohmic load conditions in DC circuits are avoided.
- Internal short circuits during commutation are prevented.
- Motor running noise is reduced (less wear)
- Output loss is reduced.

Neural grounding reactor

- Reduces short-circuit power
- Reduces harmonics

DWD three-phase AC reactors

Motor reactor

- Reduces running noise
- Reduces wear
- Reduces flank steepness

Starting reactor

- Reduces the starting current
- Low-noise, soft start
- Brief system notches are avoided
- Reduces reaction on system

Sample applications

Link reactor

- Improves efficiency
- Suppresses commutation gaps in DC circuits
- Improves the smooth running of drives

Commutating reactors, single-phase or three-phase

- Avoids reactions on system
- For norm-complying setting of the short-circuit voltage
- Dampens harmonics
- Flank steepness of commutation processes is reduced

Lamp ballast reactors

- Limits the lamp current
- Reduces the operation loss of discharge lamps
- Extends the lamps life due to adapted reactor parameters

Current dividing reactors

- Avoids extreme system load
- Prevents distribution of harmonics by the division of the system
- Choking of the short-circuit current and at the same time stabilization of the voltage in the unaffected partial system

Filter reactor

- Cuts electricity bills by compensation of reactive power content
- Reduces the system load
- Extracts undesired harmonic content

Connection methods

General installation conditions

Due to scatter, a minimum distance of 50 mm must be maintained to adjacent metal conductors. Generally, all reactors are designed for installation at altitudes up to 1000 m above sea level.

Terminals

The data in the table below refer only to the core dimensions without terminals or Cu rails. Depending on the type of connection (terminal clamp or Cu rail), the projection size must be considered as a function of the current.

Standard version max. terminal current to EN 50 019 A	max. terminal current to IEC 60 947-7-1 A	Max. conductor cross section, flexible mm ²	Projection or height of terminal Distance. c to max. height mm
38	57	6	55
57	76	10	55
72	101	16	65
112	150	35	70
135	150	50	85
210	232	95	95
265	309	150	120
300	415	240	135

Connection methods

CU-Rails

The data in the table below refers only to the core dimensions without terminals or Cu rails. Depending on the type of connection (terminal clamp or Cu rail), the projection size must be considered as a function of the current.

Current A	Hole mm	Prepared for screws	Arrangement	Projection of Cu rail rel. to b ₁ mm
63	6.6	1x(M6)		20
100	9.0	1x(M8)		25
200	11.0	1x(M10)		30
400	14.0	1x(M12)		50
630	14.0	1x(M12)		50
1000	2x14.0	2x(M12)		90
1250	2x14.0	2x(M12)		70
1600	2x14.0	2x(M12)		70
2000	4x14.0	4x(M12)		90

Type GEH

Application

for installation of reactors to comply with protection type IP 23 and IP 54, resp.
 Material: 1.5 mm sheet steel, plastic coated, finish: RAL 7032
 pebble gray

General Terms of Business 01/2002

I. General

By placing the order, the buyer accepts these "General Terms of Business" as exclusive basis for transaction of business. Buyer's terms, if any, are hereby expressly excluded and do not apply even in absence of our express objection. Any other agreements are only valid if made in writing.

II. Prices

Our prices are without obligation and quoted ex works without packaging and in EURO currency, exclusive of value-added tax, which will be charged at the rate applicable at the time of delivery. Copper prices of 150.00 EUR or more for each 100 kg lead to price adjustment prorated the specified weight.

III. Terms of payment/setting off

1. Payment due to us is defined in calendar terms (§ 286 cl. 2 no. 1 BGB - German Civil Code) and mature 30 days after invoice date.

All payments must be made free supplier's point of payment; discount at 2% can be deducted from all payments made within 10 days of the invoice date.

Deliveries to unknown buyers are only made COD.

2. The buyer can only set off payments which are not in dispute or are the subject of a final court judgment.

IV. Contract conclusion /deliveries

1. 1. Orders to agents, any collateral agreement, amendments and modifications are only binding on us if made in writing.

2. 2. Dimensions, output data and illustrations correspond to the specified products; deviations are expressly reserved.

3. All shipments are made ex works at buyer's risk. The risk passes to buyer when the consignment in a state ready for use has been shipped or collected. This also applies to all shipments made free, in our own fleet of trucks or if the goods are consigned to buyer's order. Partial shipments which the buyer can reasonably be expected to accept are permitted.

4. Goods shall be accepted immediately upon completion. If buyer delays acceptance, we can charge warehousing cost at 0.5% of the invoice amount for every month, including fractions thereof, subject to a maximum of 5% of the value of the goods.

5. All shipments are made by the agreed date as far as possible. We are responsible for delays only in cases of intent or gross negligence and if acting under the constraints of law provided the buyer can submit proof of the damage caused. The damage is limited to 5% of the value partial delivery or delivery which is delayed. Force majeure is cause for a reasonable extension of the delivery period.

V. Liability for defects

We are responsible for defects as defined in §§ 434, 435 BGB as follows:

1. All parts or services which become unusable or whose usability is substantially limited for reasons before the passing of risk, in particular due to defects of type, defective material or poor workmanship, within 60 months - irrespective of the operating time - calculated from the date at which the risk passed, shall at buyer's option be repaired free, delivered new or made new. Any defect must be communicated to us in writing without delay. The term for electronic devices is 36 months. If buyer's choice (repair or replacement) entails unreasonably high cost, we can refer the buyer to a version which is less expensive for us.

2. Buyer must allow us reasonable time and opportunity for repairing a defect. Otherwise we are released from our liability for the defect.

3. Any other claims by buyer on us are excluded unless such claims are substantiated in applicable law. Damage claims on grounds of impossibility of performance for which we are responsible or due to unavoidable statutory requirements are limited to 10 % of the value of that part of the delivery which cannot be used as intended.

VI. Retention of title

1. All goods shipped remain our property until full payment of all amounts due to us from the business transaction with the buyer is made or if payment is made by check or draft until paid. The buyer can dispose of the goods in the ordinary course of business.

2. 2. The retention of title also extends to the full value of all products made by processing, mingling or combining our goods and we are also considered to be the maker of these products. If in the processing, mingling or combination of our goods with goods belonging to a third party that party's title survives, we acquire co-ownership in the new goods in the value represented by the respective invoice amounts of the processed goods.

3. 3. Buyer assigns to us all claims on third parties created by the sale of the processed goods as security in the full amount or in the amount of our co-ownership (sub-article 2). Buyer can collect these amounts for our account until cancellation or completion of buyer's payments to us.

4. Any seizure by a third party of goods or moneys belonging to us must be communicated to us by buyer in writing without delay.

5. 5. The goods and payment claims in lieu of goods must not be pledged or offered as security or assigned unless full payment has been made to us.

6. 6. If the value of the securities exceeds the amount due to us by more than 20%, we will release an appropriate part of the securities in our option if so requested by the buyer

VII. Place of performance / legal venue

1. Place of performance for supplies and payments is Heiligenstadt/Ofr. or Jena.

2. If the buyer is a general merchant, the legal venue, including for summary proceedings, is Bamberg or Jena.

3. The contract is subject to material German law to the exclusion of the UN Convention on Contracts for the International Sale of Goods (CISG).

VIII. Severability

If a provision of these General Terms of Business should be or become invalid, such invalidity does not affect the other provisions. The provision lacking validity will be replaced by another provision which as nearly as possible reflects the original intention. If this is not possible, the contract is invalid if continuing it would entail unreasonable hardship for either party.
