# 1. MAC AC Servo Motors

**Applications** AC servo motors of the MAC series are rapid-response servo drives in conjunction with TDM, KDS and DSC drive controllers. They are especially well-suited for use in:

- machine tools,
- textile machines,
- printing presses,
- packaging machinery,
- robotics,
- handling equipment and
- transfer facilities.

Fig 1.1: Applications example: a machining center with four axes with tool and workpiece handling facilities

Overview of power ratings

Figure 1.2 illustrates the available motor line with the power features, "continuous torque at standstill  $M_{dN}$ " and "nominal speed  $n$ ".

Fig 1.2: Power ratings

Construction and components of the motor

MAC AC servo motors are permanent magnet-excited motors with electronic commutation. The permanent magnets of the rotor are made up of materials which make it possible to construct motors with very low inertia.

Figure 1.3 illustrates the basic construction and components of a MAC AC servo motor.

Fig 1.3: The structure of a MAC AC servo motor

#### Motor feedback

The motor feedback of a MAC AC servo motor is always made up of one tachofeedback. The motor can also be additionally equipped with a mounted encoder for position evaluation.

#### Tachofeedback

For speed evaluation per tacho-generator and rotor position recognition, the motors are equipped with a tachofeedback especially developed for this series. It is always integrated into the motor.

#### Mounted encoder

For position evaluation on the motor, the motor can also be equipped with:

- a second shaft end to mount the customer's own encoders,
- an incremental encoder and
- an absolute encoder.

Operating reliability	<p>MAC motors achieve a <b>high degree of reliability</b> as a result of the following structural features:</p> <ul style="list-style-type: none"> <li>• Maintenance-free operation due to: <ul style="list-style-type: none"> <li>- the brushless design of the motor and</li> <li>- the use of life-time lubricated bearings.</li> </ul> </li> <li>• Can be used directly within the working area of the machine even under poor environmental conditions such as affects of coolants, soluble oil emulsions and so on: <ul style="list-style-type: none"> <li>- because the motor housing is totally enclosed as per protection category IP 65</li> <li>- because the motor power and tachofeedback cables as well as the encoder cables are designed to meet IP 65 demands.</li> </ul> </li> <li>• Motor temperature is monitored with thermo switches integrated into the motor windings and stator housing. This prevents overload damage.</li> </ul>
Output data	<p>The <b>output data of the motor is high</b>. This is described in detail as follows:</p> <ul style="list-style-type: none"> <li>• High dynamic performance due to favorable torque-inertia ratio.</li> <li>• A high overload capacity of the motor as the heat is dissipated from the stator windings to the outside wall of the motor housing.</li> <li>• Utilization of peak torque over a wide speed range.</li> <li>• High power to weight ratio due to compact construction.</li> <li>• High cyclic load capacity permits continuous start-stop operations with high repetition rates due to electronic commutation of the motor.</li> <li>• Excellent smooth running qualities resulting from the special design of the stator and high-resolution tachofeedback.</li> </ul>
Installation on the machine	<p><b>Mounting</b> the motor to the machine <b>is simple</b>.</p> <ul style="list-style-type: none"> <li>• Pinions and belt pulleys can be directly mounted onto the shaft because the design of the bearing assembly makes the application of high radial loads possible.</li> <li>• There is a defined assimilation of outside forces at the motor shaft. This means that the floating bearing of side A of the motor absorbs the radial forces. Side B absorbs the axial forces.</li> <li>• Thermal deformations affect side A.</li> <li>• The motor can be mounted in any orientation.</li> <li>• Flange design with throughholes in the flange makes it possible to mount as per design IM B5 or with windings in the flange as per design IM B14.</li> <li>• A variety of ready-made cables is available, eliminating additional installation work.</li> </ul>
Cooling	<p>The MAC AC servo motors are available with surface cooling for extreme loads. An overview of the blower options for the individual series is offered in Section 2.2, Figure 2.11.</p>

- Holding brake** MAC motors can be delivered with or without holding brakes.
- The holding brake makes it possible to clamp (hold into place) the output shaft at standstill. This achieves a safe standstill of the axis even when power is off.
- Output shaft** The output shaft is available in two different designs:
- as a plain shaft for non-positive shaft-hub connections and
  - shafts with keyways for form-fitting shaft-hub connections.
- Smooth run** The MAC 090 and 112 AC servo motors are available with a special windings design which achieves a high degree of smooth run. It is particularly well-suited for use in grinding machines and precision lathes.
- It must be designated in type code field 5 with a "G". In this case, the tacho design with increased smooth run should be used as motor feedback (type code field 6 with an "F").
- Electrical connections** The power, tachofeedback and encoder cables are directly connected to the motor with the use of connectors on the corresponding flanged sockets.
- Labelling the sides** To make sure that the sides of the MAC are clearly labelled and that there is no confusion, they have been fixed and illustrated in the figure below.

Fig 1.4: Labelling the sides of the MAC servo motor

## 2. Technical Data

This section outlines a description of the ambient conditions, the mechanical and electrical features of the motor as well as the motor feedback. Section 2.5 offers important details about the torque-speed characteristics which are, in turn, depicted for each motor type in sections 3.2, 4.2 through 8.2.

### 2.1. Ambient Conditions

Installation elevation  
and ambient  
temperatures

The output data outlined in the section "Technical Data" are achieved under the following conditions:

Ambient temperature: 0 ... + 45 °C

Installation elevation: 0 ... 1000 meters above sea level

If the conditions deviate from the values, then the output data will decrease as depicted in the diagrams of Figure 2.1. If higher ambient temperatures and higher installation elevations occur simultaneously, then the load factors  $f_T$  and  $f_H$  must be multiplied.

Fig 2.1: Load capacities at higher ambient temperatures and higher installation elevations

Protection category

The MAC motors are protected by their housing and covers which in construction and design adhere to the guidelines found in DIN 40 050 and are, therefore, protected against:

- contact with motor parts either moving or alive (contact guards),
- penetration by extrinsic objects and
- penetration of water.

The protection categories are laid down by the abbreviation IP (International Protection) and two numbers for the type of protection, e.g., IP 65.

The first number represents the degree of protection afforded against contact and penetration by extrinsic objects (see Figure 2.2). The second number represents the degree of protection afforded against the damaging penetration by water (see Figure 2.3).

Figure 2.4 depicts the range of the protection categories as applicable to MAC motors.

First digit	Protection against contact and extrinsic objects
0	Little or no protection.
1	Protection against penetration by extrinsic objects with a diameter exceeding 50 mm. No protection against direct access, e.g., by a hand. Will keep larger body surfaces out, however.
2	Protection against penetration by extrinsic objects with a diameter exceeding 12 mm. Will keep fingers or similar objects out.
3	Protection against penetration by extrinsic objects with a diameter exceeding 2.5 mm. Keeps out tools, wiring or similar objects thicker than 2.5 mm.
4	Protection against penetration by extrinsic objects with a diameter exceeding 1 mm. Keeps out tools, wiring or similar objects thicker than 1 mm.
5	Protection against damaging dust. Complete penetration by dust is not prevented, but the dust may not be permitted to penetrate to the extent that the operation of the electrical equipment is in any way hindered (protected against dust). Complete protection against penetration by extrinsic objects.
6	Protection against the penetration of dust (dust-free). Complete protection against penetration by extrinsic objects.

Fig 2.2: Protection grades - contact and penetration per DIN 40050, sec. 2 (6/72 edition)

Second digit	Protection against Water
0	Little or not protection.
1	Protection against vertically dripping water (dripping or trickling water). It may not have any destructive affects.
2	Protection against vertically dripping water. It may not have any adverse affects on electrical equipment tilted up to 15° in contrast to its normal position (water dripping or trickling at an angle).
3	Protection against water falling at an angle of up to 60°. Does not permit any damaging affects (sprayed water).
4	Protection against water sprayed at the equipment (housing) from all directions. Does not permit any damaging affects (splashwater).
5	Protection against a jet of water sprayed from a nozzle onto the equipment (housing) from all directions. Does not permit any damaging affects (jet of water).

Fig 2.3: Protection grades for water per DIN 40050, sec. 2 (6/72 edition)

Fig 2.4: Range of protection categories of MAC motors

Ambient mechanical conditions

MAC servo motors can be operated in a stationary manner under weather-proofed conditions as per IEC 721-3-3, the 1987 edition, or EN 60721-3-3 the 6/94 edition:

- as per class 3M1 respective the longitudinal axis of the motor and
- as per class 3M6 respective the lateral axis of the motor.

The maximum values stated in Figure 2.5 thus apply to transportation and operation of MAC servo motors.

Environmental variables		Unit	Maximum values longitudinal axis	Maximum values lateral axis
sinusoidal oscillations	excursion amplitude	mm	0.3	7.0
	frequency range	Hz	2 to 9	2 to 9
	acceleration amplitude	m/s <sup>2</sup>	1	20
	frequency range	Hz	9 to 200	9 to 200
shocks	total shock-response spectrum	-	Type L per IEC 721-1 edition of 1990, table 1 section 6	Type II per IEC 721-1 edition of 1990, table 1 section 6
	reference acceleration (in IEC 721-1 peak acceleration)	m/s <sup>2</sup>	40	250
	duration	ms	22	6

Fig 2.5: Maximum values of the environmental variables

MAC servo motors are only suited for such extreme demands as is the case with punching, pressing, press feeds and similar applications, if shock-damped mounted or mounted shock decoupled.

We cannot recommend a generally applicable solution for shock-damped mounting. It is dependent on the respective construction of the machine and the results of metrological tests.

A shock-damped variant for incremental encoders is available for the MAC AC servo motors. This has been tested for punching, pressing and press feed applications.

**Housing coat** The housing of the MAC motors is painted with a black prime coat. An additional layer of paint can cover this prime coat. The thickness of the layer may, however, not exceed 40 µm.

This prime coat is resistant to:

- weathering, yellowing and chalky build-ups as well as
- diluted acids and lyes

The coat can, however, peel if the housing is frequently cleaned with a steam cleaner.

## 2.2. Mechanical Features

**Construction and mounting orientation** The mounting flange is designed, in all types of motors, in such a way that mounting as per design B5, i.e., mounting with flange with throughholes, is possible.

Mounting mode as per design B14, i.e., mounting flange with windings, is **additionally** possible in the following motors:

- MAC 090
- MAC 093
- MAC 112
- MAC 115

Figure 2.6 demonstrates the ways that the motors can be mounted to the machine as per DIN 42950, section 1, the 8/77 edition.

Construction	Permissible mounting orientations per DIN IEC 34-7		
B05	 IM B5	 IM V1	 IM V3
B14	 IM B14	 IM V18	 IM V19

Fig 2.6: Permissible mounting orientations

**In those cases where the motors are mounted in orientations IM V3 and IM V19, it is necessary to prevent liquids from collecting at the output shaft over extended periods of time. Even the use of a shaft sealing does not absolutely prevent liquids from penetrating, along the output shaft, into the housing of the motor.**

#### Pilot diameter

To generate compatibility with the motors of other manufacturers, it is possible to also select a mounting flange with a customized pilot diameter in addition to the standard types. This is possible only with some of the motors. The choices and appropriate dimensions are listed in the table in Figure 2.8.

Fig 2.7: Defining the term centering / pilot diameter

Motor Series	Pilot diameter in mm	
	Standard types	Customized types
MAC 063	95	—
MAC 071	95	—
MAC 090	110	130
MAC 093	110	130
MAC 112	130	180
MAC 115	130	180

Fig 2.8: Pilot diameters for the individual motor series

#### Output shaft

The design of the output shaft can be selected by the user. INDRAMAT recommends the use of plain output shafts.

##### Plain output shaft

A backlash-free and non-positive transmission of torque can be achieved with a plain shaft. Clamping sets, pressure sleeves or similar clamping components can be used for coupling pinions, belt pulleys or similar elements.

##### Output shaft with keyway

The output shaft with keyway adheres to the requirements specified in DIN 6885, sheet 1, 8/68 edition. This achieves a form-fitting torque transmission. This type of shaft-hub connection is suitable for lesser demands. A multi-

axial stress state occurs at the shaft-hub connection as a result of torsion, bending, radial and axial loads. It is possible, during powerful reverse operations, for the bottom of the key to turn out and reduce the quality of concentricity. Ever-increasing deformations can cause fractures. The use of plain shaft ends with friction-locked connections is therefore recommended.

**Shaft sealing** The shaft sealing is attached to the flange. It ensures that no liquids can penetrate into the motor housing along the shaft. An output shaft with shaft sealing is required for those applications where dirt or the affects of a jet of water can be present. The protection category in this case is IP 65.

In the MAC 071, 090, 093, 112 and 115, the output shafts are always equipped with a shaft sealing.

In the MAC 063 line, the output shaft can be selected with or without the sealing. The output shaft of this line is generally not equipped with the ring. The protection category in this case is IP 50.

**Permissible shaft load** Load is applied to the shaft as soon as radial or axial forces affect the motor shaft.

The **permissible radial force** (radial shaft load) is depicted in a diagram in sections "Shaft Load Capacity", i.e., sections 3.3., 4.3 and so on.

The permissible radial force is depicted in terms of

- the average speed
- and the point of application of force.

The **permissible axial force** (axial shaft load) can be calculated with the aid of a formula. It can be found in this section.

**Thermal deformations**

**Thermal deformations in length affect side A of the motor. This means that the A side of the motor shaft end can shift up to 0.6 mm with respect to the motor housing. As a result, there**

- **is a shifting of position by using drive pinions with helical teeth mounted to the motor output shaft but not axially fixed to the machine or**
- **thermal stress is occurring by using drive pinions with helical teeth axially fixed to the machine with bevel gear pinions. The latter can lead to damage on side B of the motor.**

**Cooling** For extreme loads, as is, for example, the case with continuous start-stop operations with a high level of repetitive frequency, it is possible to mount a surface-cooling unit to some of the motors.

Blower motors, operating with 1 x AC 230 V and AC 115 V, are available.

#### **Axial surface cooling**

Axial cooling is suited for those applications that need a slender form.

Axial surface-cooling units are not available for motors with a second shaft end. What is available for each line of motor is listed in the table in Figure 2.11.

Fig 2.9: An example of a MAC servo motor with axial surface cooling

### Radial surface cooling

Radial cooling is suited for those applications that need a short construction.

The use of radial surface-cooling units is recommended in those cases where shock loads are high.

If a radial surface-cooling unit is to be mounted on the motor, then the arrangement of the blower unit on the motor must be determined. The following possibilities are available with every line of motor (looking towards motor shaft):

- the blower is located under the motor shaft,
- the blower is to the left of the motor shaft or
- the blower is to the right of the motor shaft.

Radial surface cooling is not available for the MAC 063 motors with motor length A.

Fig 2.10: An example of a MAC servo motor with radial surface cooling with the blower under the motor shaft

The blower options for the individual motor series are listed in the table found in Figure 2.11.

Motor type	Blower for surface cooling	
	axial	radial
MAC 063	+ 2) 3)	+ 1)
MAC 071	+ 2)	+
MAC 090	+ 2)	+
MAC 093	+ 2)	+
MAC 112	+ 2)	+
MAC 115	+ 2)	+
+ available 1) not available for motor length A 2) not available for motors with tachofeedback and second shaft end 3) not available for motors with tachofeedback and mounted encoder		

Fig 2.11: Blower options

**Holding brake** For a backlash-free holding of the servo axes when the machine is powered off, it is possible to equip them with a holding brake.

The holding brake, especially developed for those motors, works along the closed-circuit principle. At zero current, a magnetic force acts on the brake armature disc. This means that the brake is locked and holding off the axis. With the application of 24 V DC, the electrical field cancels the permanent magnetic field and the brake opens.

The customer is responsible for the control of the holding brake with the use of either a PLC or a hardware switch. Various recommendations are outlined in the Applications Manual for "MAC Servo Drives with Servo Drive Modules TDM and KDS".

**The holding brake alone cannot guarantee the safety of personnel as it can fail or wear down. Additional measures must be taken to ensure personnel safety. These must be undertaken by the manufacturer of the machine and can, for example, be the mounting of a second brake.**

**The holding brake is not a working brake. It can wear down after 20,000 motor revolutions against the closed brake.**

If the motor has been stored for any extensive period of time, then the following guidelines should be noted before commissioning it:

If the motor is stored for a period exceeding two years, then it is necessary to grind it in before using it.

To grind it in:

1. Run the motor at a speed of approximately 100 speed.
2. Close the holding brake and keep it closed for approximately 60 seconds.

**Note:** Open the conductor of the holding brake to the PLC or the hardware circuitry.

3. Shut down the drive after 60 seconds.
4. Reconnect the holding brake to the PLC or the hardware circuitry.

The holding brake is available with the following holding torques for each respective motor series.

Holding torque	MAC ...					
	063	071	090	093	112	115
3 Nm	X	X				
6.5 Nm		X	X	X		
14 Nm			X	X	X	
22 Nm				X		
40 Nm					X <sup>1)</sup>	
45 Nm						X
60 Nm					X <sup>1)</sup>	X

<sup>1)</sup>Not available for motor length A.

Fig 2.12: The holding torque of the holding brakes

#### Power connection

The user must order the output direction of the power connections in accordance with the conditions at the machine. The output direction cannot be altered after delivery.

The following variants are available (also see Figure 2.13):

- connector to side A
- connector to side B
- connector to the right
- connector to the left

**Note:** With the MAC 063s only the output directions towards side A or side B are available.

Fig 2.13: Possible output directions of the power connections

**Feedback connector** Different types of connectors can be selected for connecting the motor feedback cable depending upon the installation conditions. Available are:

- straight connectors and
- angle connectors.

Information about the allocation of connector type to motor type can be found in the dimensional data sheets and in section 13.2 "Connector for the Feedback".

### **Straight connector**

Figure 2.14 depicts a motor with tachofeedback and straight encoder connector.

Fig 2.14: A MAC motor with straight tachofeedback and encoder connectors

### **Angle connector**

INDRAMAT supplies and delivers the angle connectors so that the output direction of the cable, once inserted into the flanged socket, is side B of the motor.

Fig 2.15: A MAC motor with angle connector (side B is output direction at delivery)

The user can change the output direction. Just release the four fixing screws (see Figure 2.16). The connector parts can now be turned in increments of 90° into the position desired.

**Make sure that neither the gasket nor the cable cores of the cable are damaged when re-tightening the screws.**

Fig 2.16: Labelling the parts of the connector

**Angle connectors cannot be used in conjunction with an axial surface cooling unit.**

## 2.3. Electrical Features

### Terminal diagram

The terminal diagram shown in Figure 2.17 is purely schematic. It represents a checklist for all the necessary electrical connections to operate a MAC AC servo motor.

Fig 2.17: Schematic terminal diagram

The following electrical connections are on a MAC motor:

- Power connection (always present)
- Tachofeedback connection (always present)
- Incremental or absolute encoder connection (this depends on the type of motor implemented)

If a blower for surface cooling is mounted to the motor, then a motor blower connection is also there. This is not shown in the terminal diagram.

The electrical connections of INDRAMAT drives have been standardized to minimize cable diversity. Sections 12 and 13 specify the electrical connections for a given application and motor type.

**Power connection** The following connections are integrated into the power connection:

- power cable,
- connecting cable for the thermo switch(es)
- and the connecting cable for the holding brake.

There are thermo switches built into the windings of the motor and the stator housing. They are electrically connected in series and conducted together at the power connection out of the motor housing. The opening of the thermo switch must be detected either by a superordinate PLC or hardware circuitry, and then an appropriate error reaction generated as quickly as possible.

**Motor power connectors** for the electrical power connections are available for either:

- crimping or
- soldering.

Power cables with metrical diameters can be either crimped or soldered to the motor power connector. Power cables with inch diameters can only be soldered.

**Feedback connection** There is a 12-pin flanged socket on the motor for the feedback and encoder connections.

The connection diagram, available feedback cables and connectors are all outlined in section 10.

**Motor blower connection** The motor blower is integrated into the hardware circuitry as per customer requirements as, for example, via a protective motor switch which would then operate independently of the controller.

The connector cable must have three cores with a diameter of at least 0.75 mm<sup>2</sup>.

Fig 2.18: How to connect the blower

## Connecting the cable to the motor blower

The following steps describe how to connect the cable to the motor blower. The individual parts of the connector are illustrated in Figure 2.19.

Procedure:

**The cable may only be connected by either an electrician or trained personnel under the supervision of an electrician.**

1. Release conduit thread screw (6) (SW 17).
2. Remove slotted screw (1) with screw driver (5) from flanged socket (4).
3. Remove connector housing (2) with connector insert (3) from flanged socket (4).
4. Pull out slotted screw (1).
5. Pull connector insert (3) out of connector housing (2) with screw driver (5) (see Figure 2.19).
6. Slide conduit thread screwed joint (6), ring (7), gasket (8) and connector housing (2) onto the cable (3x0.75 mm<sup>2</sup>).
7. Strip cable sheath at a length of approx. 20 mm, strip litz wire for approx. 10 mm. Now connect as per terminal diagram in Figure 2.18 to the terminal box in the connector insert (3).
8. Push connector insert (3) into connector housing (2), attach slotted screw (1) and screw connector onto flanged socket (4).
9. Remount conduit thread screwed joint (6) making sure strain relief is adequate!

Fig 2.19: The parts of a blower connector

## 2.4. Motor Feedback

The motors are equipped with a motor feedback for the evaluation of position and speed and for the detection of rotor position. The motors are available in those versions illustrated in Figure 2.20.

**Versions** The motor feedback is always made up of a tachofeedback and can be additionally fitted with an encoder.

	Tachofeedback
	Tachofeedback with second shaft end (for mounting the encoder of the customer)
	Tachofeedback with mounted encoder (Incremental or absolute encoder)

Fig 2.20: Available motor feedback versions

### 2.4.1. Tachofeedback

This design makes it possible to detect and evaluate both rotor position and velocity. The velocity feedback value is generated with residual ripple in some models and is suited for:

- either standard applications (tacho type „C“; see type code)
- applications with extreme high smooth run qualities (tacho type „F“; see type code)

The "Tachofeedback" version can be used in all machines in which there is, for example, a direct position evaluation via a linear scale or with applications with uniform rotations.

Tacho voltage can be selected to meet the following:

- to match nominal motor speed  
With a nominal speed of  $> 3000 \text{ min}^{-1}$  tacho voltage equals  $1.5\text{V}/1000 \text{ min}^{-1}$ .  
With a nominal motor speed of  $\leq 3000 \text{ min}^{-1}$  tacho voltage equals  $3\text{V}/1000 \text{ min}^{-1}$ .
- $1.5 \text{ V}/1000 \text{ min}^{-1}$  for speeds exceeding  $3200 \text{ min}^{-1}$  in motors with a maximum nominal speed of  $3000 \text{ min}^{-1}$
- $6 \text{ V}/1000 \text{ min}^{-1}$  for applications making higher demands of the resistance to interference in tachofeedback lines or requiring smooth run qualities at a maximum nominal speed of  $1600 \text{ min}^{-1}$ .

The options for each line of motor have been compiled in Table 2.21.

Motor Series	Tacho version	Tacho Voltage		
		matches nominal motor speed	1.5 V 1000 min <sup>-1</sup>	6 V 1000 min <sup>-1</sup>
063	standard	X		
	higher smooth run quality	X		
071	standard	X	X	
	higher smooth run quality	X	X	
090	standard	X	X	
	higher smooth run quality	X	X	X
093	standard	X	X	
	higher smooth run quality	X	X	
112	standard	X	X	
	higher smooth run quality	X	X	X
115	standard	X	X	
	higher smooth run quality	X	X	

Fig 2.21: Optional tachofeedbacks and allocation to motor series

#### 2.4.2. Tachofeedback and Second Shaft End

This version is identical to the version "Tachofeedback", expanded, however, with an accessible second shaft end on side B of the motor. Additional components, encoders in particular, can be mounted hereto.

The second shaft end has a protection category of IP 65, i.e., the component mounted does not need to be completely sealed.

Fig 2.22: MAC servo motor with tachofeedback and a second shaft end

### 2.4.3. Tachofeedback with Mounted Encoder

This version corresponds to the "Tachofeedback" version with respect to the detection of velocity feedback value and rotor position. Mounted encoders in the following versions are available for position detection and evaluation:

- Standardly mounted incremental encoder for use with machines with lower shock loads.
- Incremental encoders with shock-damped mounting for use in presses, stamping machines and similar machinery
- and an absolute encoder

These mounted encoders have been especially designed for INDRAMAT motors and are extremely resistant to environmental conditions.

These are introduced in greater detail in sections 2.4.4. and 2.4.5.

Fig 2.23: MAC servo motor tachofeedback with mounted encoder (ex: incremental encoder)

#### 2.4.4. Incremental Encoders

Incremental encoders work with either square-wave pulses or sinusoidal signals. They are available to accommodate different supply voltages. The available versions are listed in Figure 2.24.

No. of pulses/ no. of lines	Pulse		
	Square-wave signal		Sinusoidal signal
	Supply voltage		Supply voltage
	5V	10 - 16V	5V
50	568LV		
125	542LV		
200	553LV		
250	515LV		527BX
400	516LV	634LX	
500	517LV		
600	572LV		
625	524LV		
900			593BX
1.000	518LV		647BX
1.024	519LV		
1.250	520LV	637LX	
1.500	538LV		
1.800	574LV		
2.000	521LV		
2.500	522LV		
3.600	594LV		
5.000	511LV		
Incremental encoders can only be mounted to MAC 063s with natural convection or radial surface-cooling units.			

Fig 2.24: Incremental encoder options

<b>Voltage source:</b>	5 V, $\pm 5\%$
<b>Current consumption:</b>	150 mA
<b>Signal level:</b>	$U(\text{high}) \geq 2.5\text{ V}$ ; $U(\text{low}) \leq 0.5\text{ V}$ ; at 20 mA
<b>Load capacity:</b>	20 mA at "high" and "low" signal
<b>Total operating time:</b>	rise and fall times $\leq 200\text{ ns}$
<b>Maximum sampling frequency:</b>	300 kHz
<b>Incremental encoder signal:</b>	TTL - square wave pulse sequence and its inverted signals with a rotational field towards the right when looking towards the motor shaft

### Recommended switching of the secondary electronics:

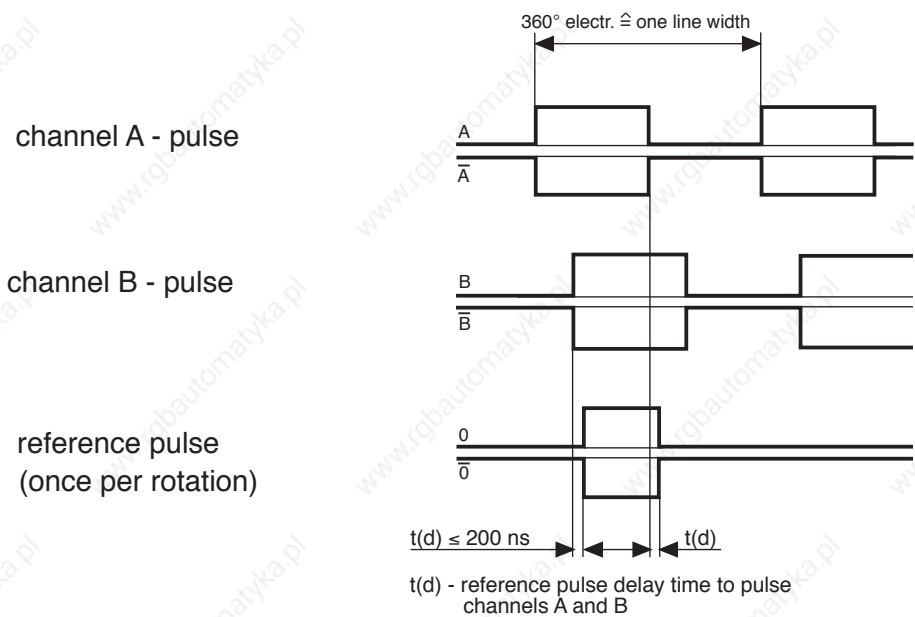

$R = 4,7\text{ k}\Omega$ ; prevents switching in the event of a break in the line  
 $C = 1\text{ nF} \dots 10\text{ nF}$ ; decreases the current consumption of the encoder  
 $Z_0 = 120\ \Omega \dots 140\ \Omega$ ; as per characteristic wave impedance of cable

TDANBAUINKR5V

<b>Voltage source:</b>	10-16 V
<b>Current consumption:</b>	220 mA
<b>Signal level:</b>	$U(\text{high}) \geq 7 \text{ V}$ ; $U(\text{low}) \leq 2 \text{ V}$
<b>Load capacity:</b>	60 mA with "high" and "low" signal
<b>Total operating time:</b>	rise and fall time $\leq 200 \text{ ns}$
<b>Maximum sampling frequency:</b>	75 kHz
<b>Incremental encoder signal:</b>	TTL - square wave pulse sequence and its inverted signals with a rotational field towards the right when looking towards the motor shaft

### Recommended switching of the secondary electronics:

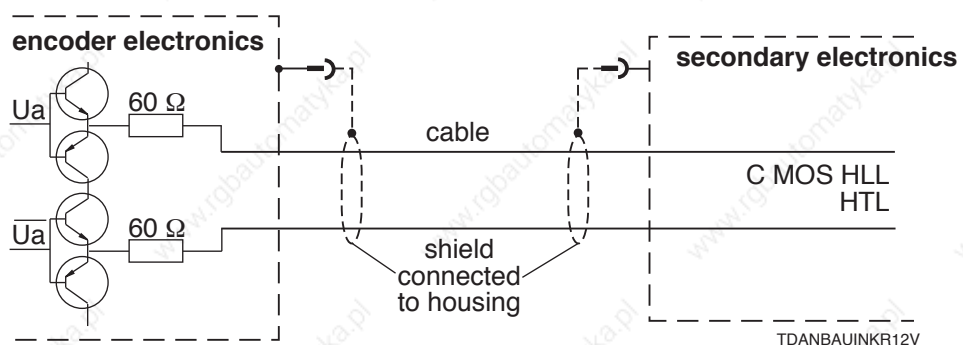

Fig 2.26: Incremental encoder, technical data, 12V voltage supplied, square-wave pulse

**Voltage source:**  $5\text{ V} \pm 5\%$

**Current consumption:** 120 mA

**Signal:** two current signals  $I_{e1}$  and  $I_{e2}$  approaching sinusoidal shape

**Signal size with load of 1 k $\Omega$ :**  $I_{e1}$  approx. 11  $\mu\text{A}$  ss  
 $I_{e2}$  approx. 11  $\mu\text{A}$  ss

**Reference signal:** 1 signal  $I_{e0}$  per revolution

**maximum scanning frequency:** depends on slave electronics

**Incremental encoder signals:**

output signals

$I_{e1}$

$I_{e2}$

reference pulse

$I_{e0}$

**Speed:**

$$\frac{0 \text{ to } f_{\max} \text{ (kHz)}}{Z} \cdot 10^3 \cdot 60 \text{ min}^{-1}$$

$Z$  = number of lines

$f_{\max}$  = maximum input frequency of slave electronics

TDInkrSINUS

Fig 2.27: Incremental encoder, technical data, 5V voltage supplied, sinusoidal signals

### Setting the reference point

If INDRAMAT MAC servo motors are supplied with mounted incremental encoders and **motor output shafts with keyway**, then the reference point of the encoder is set to a defined angular position. This defined angular position of the reference point to the keyway of the motor output shaft makes it possible, if procedures are followed, to replace drives without adjustment work thus eliminating the risk of unnoticed dimensional displacements.

Fig 2.28: Standard position of the output shaft with keyway with encoder reference position in a MAC motor

The reference point can be mechanically changed if incremental encoders are used in MAC AC servo motors.

This is possible with:

- motors without surface cooling (natural convection)
- motors with radial surface cooling

This is not possible with:

- motors with axial surface cooling. The construction of the blower shroud determines the location of the incremental encoder connector with respect to the motor. This allocation changes, however, with the setting of the reference point!

**When replacing the drives, changing the reference point setting results in considerable dimensional shifting. It must be checked by someone capable and authorized to do so and the reference point must, then, be reset. To replace a drive without causing this problem, we recommend that the defined reference point not be reset. INDRAMAT instead recommends an adaption of the reference dimension via the control unit.**

Changing the  
reference point setting

Procedure:

**Only an electrician or properly trained personnel under the supervision of an electrician may set the reference point.**

1. Switch the power section of the drives off.
2. Lock the motor shaft.

Fig 2.29: Standard die cast housing with mounting flange

3. Remove screw covers (3).
4. Release the allen screws (4) with one-half a turn.
5. Set the desired reference point by turning the encoder housing (1) with respect to the mounting flange (2). The radial drill hole (6), diameter 4 mm, in the plastic flange (7), can be used to assist this procedure. The encoder housing can be turned 360° in both directions. This changes the position of the encoder connector to the motor (interference contour).
6. Tighten allen screw (4) with 3,6 Nm.
7. Press screw covers (3) back into place.
8. Release motor shaft lock.
9. Switch power section of the drive back on.

### 2.4.5. Absolute Encoder

The absolute encoder supplies an unequivocal (absolute) position value for every position with a change in position.

These values remain available even after there has been an emergency off or a power failure. This eliminates the need for extensive referencing procedures of the individual axes.

The feedback position value remains available after the machine is switched back on even in the event that the axis of the machine were moved when in a currentless state.

In addition to the absolute position represented in terms of  $360^\circ$ , the absolute encoder also represents a defined number of resolutions in terms of absolute units. This resolution equals 24 bit, gray code, 4096 increments /  $360^\circ \cdot 4096$  resolutions.

Figure 2.30 lists the designations of the absolute encoder.

Designation	No. of pulses	Supply source in V	MAC...					
			063	071	090	093	112	115
144SG	4096 • 4096	10-32	X					
154SG	4096 • 4096	10-32		X				
164SG	4096 • 4096	10-32			X	X	X	X

Fig 2.30: Designations of the absolute encoder

<b>Voltage source:</b>	5 V - 32 V DC, protected against polarity reversal
<b>Current consumption:</b>	$\leq 3$ W
<b>Scan code:</b>	Gray Code
<b>Clockwise counting direction looking onto shaft:</b>	rising
<b>Data transmission:</b>	synchronous, serial
<b>Serial data output:</b>	driver per EIA RS 422, secured against short-circuits
<b>Monoflop time <math>t_m</math>:</b>	$15 \mu\text{s} < t_m < 25 \mu\text{s}$
<b>Clock frequency:</b>	200 kHz
<b>Minimum phase break:</b>	$30 \mu\text{s}$
<b>Data format:</b>	24 Bit
<b>Protection category in mounted state:</b>	IP 65

PFB = power failure bit

T = pulse signal duration

$t_m$  = monoflop time

#### Power failure bit

If the power supply ( $> 5$  V) is interrupted for periods exceeding  $100 \mu\text{s}$  then the encoder information can be false.

The power failure bit (PFB) identifies this error. In the event of a voltage interrupt, the PFB in the serial information is set to logical 1 via a comparator.

Delay time  $T_v$ : max 300 ns (clock (+) to data (+) or data (-))

#### Clock input circuitry

#### Data output circuitry

As per EIA RS 422, short-circuit proof

TDABSOLUT

Fig 2.31: Absolute encoder - technical data

## Replacing the encoder

The absolute encoders which INDRAMAT mounts represent measuring systems of the highest quality developed for use on production machinery.

If an encoder should, however, at some point need to be replaced, then an entire replacement unit can be installed on site.

**Do not use harsh cleansing agents to clean components.**

**The encoder may only be operated with a screwed on filler cap (10) (see Figure 2.32) as dirt contamination can cause it to fail.**

The tools needed to work on the absolute encoder are:

- Allan key, 90° offset, SW3
- Allan key, straight, SW4
- torque key 0 to 5 Nm
- adjusting tool, part no.: 243 044

**The absolute encoder may only be mounted or removed by an electrician or by trained personnel under the supervision of an electrician.**

## Removing the absolute encoder

Procedure:

1. Switch power section of drive off.
2. Switch control voltage off.
3. Pull out encoder.

Fig 2.32: Components of an absolute encoder with tools and torque key

4. Remove filler cap (10) (Fig 2.32) out of encoder housing.
5. Place adjusting tool (11) onto the hexagon of the expander (8) and hold in this position.
6. Pull out the expander (9) with the key (SW4) using approximately six turns. **Do not use** the adjusting tool for this task!
7. Release screws (4) with the key (SW4) and pull the mounted encoder unit carefully out.
8. Check the coupling unit for wear and tear.

- If necessary, pull slotted screw out (13) with key (SW3) and pull out the clamped coupling unit of the motor shaft.

#### Preparing to mount the absolute encoder

##### Procedure:

- Remove the new unit to be mounted from its packaging.
- Remove the filler cap (10) from the encoder housing.
- Make sure there is no tension in the expander (8).
- Check whether the enclosed coupling unit can easily be slid onto the expander (8). If not, put adjusting tool onto hexagon of the expander (8) and hold. Then, using an Allan key (SW4) turn the expander (9) six turns to the left. There should now be no tension in the expander. This is the prerequisite for correctly mounting the encoder unit.

#### Mounting the absolute encoder

##### Procedure:

- Switch power section of drive off.
- Switch control voltage off.
- Remove servo motor cover (see Figure 2.33).
- Remove all grease from side B of the motor.

Fig 2.33: Mounting the absolute encoder

- Push the coupling unit (1) onto side B of the shaft end.
- Set dimension A (distance flange mounting surface to the end of the coupling unit). Dimension A: MAC 063:  $39.7 \pm 0.5$  mm  
Dimension A: MAC 071 - 115: min. 35.5 mm/max. 37 mm
- Tighten screw (13) with key (SW3) 3.4 Nm.
- Check whether O-ring (2) is properly mounted.
- Place unit carefully onto motor without tipping. Feed expander (8) into coupling unit at the same time.
- Turn connector (6) so that the angle is set for the respective motor (see dimensional data, sections 3 to 8).
- Mount unit with screws (4) and washers (3) to the motor.  
Tightening torque: 2.8 Nm for MAC 063  
5.7 Nm for MAC 071 - 115
- Place adjusting tool (11) onto expander (8) and hold in this position.

13. Tighten expander (9) with torque key (12). Torque: 3.4 Nm.
14. Screw filler cap (10) into encoder housing.
15. Put absolute encoder connector into place.
16. Apply power.
17. Switch drive on and check whether encoder is functional.
18. Run a homing procedure.

Setting the reference point of the absolute encoder

If INDRAMAT MAC servo motors are delivered with absolute encoders mounted, then it is possible to set the reference point in several different ways.

#### **Procedure 1**

Set zero point of absolute encoder to the mechanical reference point.

1. Set servo drive to the reference point (in jog mode).
2. Connect absolute encoder to the control unit.
3. Release the connection absolute encoder to motor shaft (adjusting tool, part no.: 243 044).
4. Turn absolute encoder to zero point; evaluate at control unit.
5. Conduct a test run.

#### **Procedure 2**

Set the end of the measuring range of the absolute encoder to the mechanical end of the axis.

1. Run the mechanical system into the end position.
2. Connect the absolute encoder to the control unit.
3. Release the connection absolute encoder to motor shaft (adjusting tool, part no.: 243 044).
4. Turn the absolute encoder to relevant end position.
5. Re-establish absolute encoder - motor shaft connection.
6. Conduct a test run.

#### **Procedure 3**

Conduct an electronic zero point displacement in the control unit (depends on the control unit used)

1. Absolute encoder remains clamped to the servo drive.
2. The drive is firmly connected to the mechanical system.
3. Run the servo drive to the reference point (in jog mode).
4. The absolute value of the encoder is read in and interpreted as the zero point by the control unit.

## 2.5. Torque-Speed Characteristics

This section contains explanations about the torque-speed characteristics. These are depicted for each type of motor in sections 3.2, 4.2 through 8.2.

The curves of some of the motors may deviate from the features described here. These deviations are, however, then relevantly documented

What is depicted The operating curves depict:

- the torque limiting data,
- the speed limiting data and
- the operating curves.

Fig 2.34: The torque-speed characteristics illustrated

Usage The torque-speed characteristics can be used:

- to record information from the selection documentation,
- to determine the possible maximum usable speed for a special application with known torque requirements and
- to check whether the application remains within the thermal limits of the motor. The effective torque for a critical cycle must be below the S1 continuous operating characteristics curve of the arithmetically averaged speed.

Limiting value for torque

The horizontal line  $M_{max}$  depicts the theoretically possible maximum torque of the motor. The drive can limit this maximum torque resulting from the various motor-controller combinations. It is outlined in the selection documentation.

Limiting value for speed

Maximum motor speed is determined by the DC bus voltage produced by the supply source at the drive. Depending upon the DC bus voltage at the drive, maximum torque drops at a breaking point

### DC bus with a regulated power supply

In the case of those supply modules with a regulated power supply, the power data of the drive-motor combination are not dependent on the fluctuations of the mains voltage.

**DC bus voltage with an unregulated power supply**

In the case of those supply modules with an unregulated power supply, the power data of the drive-motor combination are dependent on the fluctuations of the mains voltage. Varying power data are achieved under the following conditions at the mains:

- 10 % overvoltage
- nominal voltage
- 10 % undervoltage

The declining lines are numbered. The following allocations apply:

- [1] -DC bus voltage with a regulated power supply (e.g., KDV 4, TVD, KVR, TVR) or an unregulated power supply if AC mains input voltage is 10% higher than the rated 3 x 230 volts AC (e.g., TVM 2, KDV 1, KDV 2, KDV 3, DSC 3)
- [2] -DC bus voltage with an unregulated power supply connected to a three-phase mains rated at 3 x AC 230 V (e.g., TVM 2, KDV 1, KDV 2, KDV 3, DSC 3)
- [3] -DC bus voltage with an unregulated power supply connected to three-phase mains rated at 3 x AC 230 V with 10% undervoltage (e.g., TVM 2, KDV 1, KDV 2, KDV 3, DSC 3)

Furthermore, the speed could be limited by the tacho voltage of the tacho generator.

Allocate the curves determined by the tacho voltage of the tacho generator as follows:

- [4] -tacho generator with 3 V/1000 min<sup>-1</sup> tacho voltage
- [5] -tacho generator with 6 V/1000 min<sup>-1</sup> tacho voltage
- [6] -tacho generator with 1.5 V/1000 min<sup>-1</sup> tacho voltage

**Operating curves**

The operating curves depict the permissible continuous torque  $M_{dN}$  (operating mode S1) and the intermittent operating torque  $M_{KB}$  (operating mode S6 per DIN VDE 0530; 7/91 edition).

The following allocations apply:

- S1-continuous curve of the motor with natural convection
- - - - - S1-continuous curve of a motor with surface cooling
- - - - - S6-intermittent operating curve:  
at an ON time of 25 % of the motor with natural convection or with the ON time indicated in the curve with surface cooling. Maximum duty cycle time is indicated in Figure 2.35.

Motor series MAC ...	Maximum duty cycle time
063	10 min.
071, 090, 093, 112, 115	15 min.

Fig 2.35: Maximum duty cycle time with intermittent operations

### 3.7. Available Options

Type code fields		Example: MAC 063 A-0-RS-4 - C/095-A-0/WI 520LV/S000	
1. Motor for analogue drives	MAC		
2. Motor size	063		
3. Motor length	A, B, C, D		
4. Type of cooling:			
natural convection		surface cooling	
0	axial		radial
			blower right    blower below    blower left
	AC 230 V	AC 115 V	AC 230 V    AC 115 V    AC 230 V    AC 115 V
	1 <sup>1)</sup>	2 <sup>1)</sup>	6 <sup>3)</sup> A <sup>3)</sup> 7 <sup>3)</sup> B <sup>3)</sup> 8 <sup>3)</sup> C <sup>3)</sup>
5. Type of windings			
Nominal rpm	Motor length		
	A	B	C    D
3500 min <sup>-1</sup>	ES	GS	MS    JS
6000 min <sup>-1</sup>	RS	JS	HS    FS
6. Motor feedback			
Motor type			
with tachofeedback		2	
with tachofeedback and second shaft end		3	
with tachofeedback and mounted incremental or absolute encoder		4	
Tacho voltage			
set to nominal motor speed: 1.5 V/1000 min <sup>-1</sup>		-	
Tacho type			
standard		C	
increased smooth run quality		F	
7. Centering diameter			
for design B05		095	
8. Power connection			
connector to side A		A	
connector to side B		B	
9. Blocking brake			
without blocking brake		0	
with standard blocking brake (3 Nm)		1	
Mounted encoder	10. Type <sup>2)</sup>		
	Incremental encoder with standard mounting		WI
	Absolute encoder		AM
11. Encoder code <sup>2)</sup>			
For available types, see section 2.4 "Motor feedback"			
12. Special types			
Fixed and documented by INDRAMAT with special number (see Drawing no.: 106-0105-4301-XX)			
Does not apply to standard motors.			

1) For type 3 motors (with 2nd shaft end and tachofeedback).  
Not available with axial surface cooling.

2) Type code fields 10 and 11 do not apply to motor types 2 and 3.

3) not available with motor length A

#### 4.4. Dimensional Data - Natural Convection

Detail Y

(A) Dimensional table Dim. A

Size	Dim. A <sup>1)</sup>
MAC 071 A	212
MAC 071 B	252
MAC 071 C	292

1) Bigger with some options. The then applicable dimension is indicated under the respective feature.

(B) Position accuracy in terms of concentricity, excentricity and coaxiality to the shaft per DIN 42955, tolerance class N, 12/81 edition.

- (C) • Shaft end per DIN 748 section 3, 7/75 edition, IEC 72, 1971 edition, cylindrical  
 • Center spigot DS M6-16 per DIN 332 section 2, 5/83 edition  
 • Max. tightening torque  $M_A$  for screws in the threads of the center spigot: 2Nm

- (D) Flange type per DIN 42948, 11/65 edition, makes mounting possible  
 • as per design B5 (throughhole in flange)

- (E) **Motor power connector**  
 INS 108 must be ordered separately.

- (F) **Tachofeedback connector:**  
 Must be ordered separately.

Table

Name	Conn. type	Dim. F
straight connector	INS 302	116
	INS 102	118
angle conn.	INS 352 INS 312	114

MB071-0/1

Fig 4.13: Dimensional data - MAC 071 (natural convection)

## Available options

### 1 Power connection

The output direction of the electrical power connector is selected at the time the order is placed. Possible output directions are:

- to side A
- to side B
- to the right
- to the left

The drawing depicts side A as output direction. The dimensions of any other direction are obtained by a virtual turning of the connector housing around the Z axis.

### 2 Motor version

- Tachofeedback and second shaft end

- Tachofeedback and mounted incremental encoder

#### Incremental encoder connector

Must be ordered separately.

Name	Conn. type	Dim. G
straight conn.	INS 301	88
	INS 101	90
angle conn.	INS 351 INS 311	86

- Tachofeedback and mounted absolute encoder (see following page)

MB071-0/2

## 6.4. Dimensional data - natural convection

Fig 6.13: Dimensional data - MAC 093 (natural convection)

## Available options

### 1 Power connection

The output direction of the electrical power connector is selected at the time the order is placed. Possible output directions are:

- to side A
- to side B
- to the right
- to the left

The drawing depicts side A as output direction. The dimensions of any other direction are obtained by a virtual turning of the connector housing around the Z axis.

### 2 Motor version

- Tachofeedback and second shaft end

- Tachofeedback and mounted incremental encoder

#### G Incremental encoder connector

Must be ordered separately.

Name	Conn. type	Dim. G
straight conn.	INS 301	88
	INS 101	90
angle conn.	INS 351 INS 311	86

- Tachofeedback and mounted absolute encoder  
(see following page)

### 1 Power connection

The output direction of the electrical power connector is selected at the time the order is placed. Possible output directions are:

- to side A
- to side B
- to the right
- to the left

The drawing depicts side A as output direction. The dimensions of any other direction are obtained by a virtual turning of the connector housing around the Z axis.

### 2 Motor version

- Tachofeedback and second shaft end

- Tachofeedback and mounted incremental encoder

### G Incremental encoder connector

Must be ordered separately.

Name	Conn. type	Dim. G
straight conn.	INS 301	88
	INS 101	90
angle conn.	INS 351 INS 311	86

- Tachofeedback and mounted absolute encoder  
(see following page)

MB112-0/2

## 7.7. Available Options

Type code fields		Example: MAC 112 A-0-LD-4 - C/130-A-0/WI 520LV/S000	
1. Motor for analogue drives	MAC		
2. Motor size	112		
3. Motor length	A, B, C, D		
4. Type of cooling:			
natural convection	surface cooling		
	axial	radial	
		blower right	blower left
		blower below	
		AC 230 V	AC 115 V
		AC 230 V	AC 115 V
		AC 230 V	AC 115 V
		AC 230 V	AC 115 V
0	1 <sup>1)</sup> 2 <sup>1)</sup>	6 A	7 B 8 C
5. Type of windings			
Nominal rpm	Standard applications		with increased smooth run quality
	motor length		motor length
	A B C D	A B C D	
1500 min <sup>-1</sup>	ZD PD KD HD	ZG PG KG HG	
2000 min <sup>-1</sup>	VD LD HD FD	VG LG HG FG	
3000 min <sup>-1</sup>	LD GD ED ED	LG GG EG EG	
5000 min <sup>-1</sup>	-- -- CD <sup>6)</sup>	-- -- CG <sup>6)</sup>	
6. Motor feedback			
Motor type			
with tachofeedback		2	
with tachofeedback and second shaft end		3	
with tachofeedback and mounted incremental or absolute encoder		4	
Tacho voltage			
set to nominal motor speed		-	
(nominal rpm > 3000 min <sup>-1</sup> : 1.5 V/1000 min <sup>-1</sup> )			
(Nennzahl ≤ 3000 min <sup>-1</sup> : 3 V/1000 min <sup>-1</sup> )			
1.5 V/1000 min <sup>-1</sup>		H	
6 V/1000 min <sup>-1</sup> 3)		L	
Tacho type			
Standard		C	
increased smooth run quality		F	
7. Centering diameter			
for design B05 and B14		130	
for design B05 and B14		180 <sup>2)</sup>	
8. Power connection			
connector to side A		A	
connector to side B		B	
connector to right (looking onto output shaft)		R	
connector to left (looking towards output shaft)		L	
9. Blocking brake			
without blocking brake		0	
with standard blocking brake (45 Nm)		1	
with heavy-duty blocking brake (60 Nm)		2 2) 5)	
extra heavy-duty blocking brake (60 Nm)		3 2) 5)	
Mounted encoder	10. Type <sup>4)</sup>		
	Incremental encoder with standard mounting	WI	
	Incremental encoder with shock-damped mounting	DI	
	Absolute encoder	AM	
	11. Encoder code <sup>4)</sup>		
	For available types, see section 2.4 "Motor feedback"		
12. Special types			
Fixed and documented by INDRAMAT with special number (see Drawing no.: 106-0105-4301-XX)			
Does not apply to standard motors.			

1) For type 3 motors (with 2nd shaft end and tachofeedback).  
Not available with axial surface cooling.

2) Type code fields 10 and 11 do not apply to motor types 2 and 3.

3) only with tacho type "F"

4) type code fields 10 and 11 do not apply to motor types 2 and 3

5) not available with motor length A

6) not available with surface cooling

### 8.3. Shaft load capacity

Fig 8.9: Shaft load

Permissible radial force  
 $F_{\text{radial}}$

Fig 8.10: Permissible radial force

Permissible axial force  
 $F_{\text{axial}}$

$$F_{\text{axial}} = 0.35 \cdot F_{\text{radial}}$$

$F_{\text{axial}}$  - Permissible axial force

$F_{\text{radial}}$  - Permissible radial force

#### 8.4. Dimensional data - natural convection

- Shaft end per DIN 748 section 3, 7/75 edition, IEC 72, 1971 edition, cylindrical
  - Center spigot DS M8-19 per DIN 332 section 2, 5/83 edition
  - Max. tightening torque  $M_A$  for screws in the threads of the center spigot: 5Nm
- (D) Flange type per DIN 42948, 11/65 edition, makes mounting possible
- as per design B5 (throughhole in flange)
  - as per design B14 (threads in flange)

- ⑤ **Motor power connector**  
INS 172 must be ordered separately.

- Ⓡ **Tachofeedback connector:**  
Must be ordered separately.

### Dimensional table Dim. A

Size \ Dim.	A <sup>1)</sup>	S5 <sup>1)</sup>
MAC 115 A	357	52.5
MAC 115 B	407	52.5
MAC 115 C	457	52.5
MAC 115 D	507	52.5

1) Bigger with some options. The then applicable dimension is indicated under the respective feature.

- Ⓑ Position accuracy in terms of concentricity, excentricity and coaxiality to the shaft per DIN 42955, tolerance class N, 12/81 edition.

Table

Name	Conn. type	Dim. F
straight connector	 INS 302	123
	 INS 102	125
angle conn.	 INS 352	121
	 INS 312	

MB115-0/1

Fig 8.11: Dimensional data - MAC 115 (natural convection)

## Available options

### 1 Power connection

The output direction of the electrical power connector is selected at the time the order is placed. Possible output directions are:

- to side A
- to side B
- to the right
- to the left

The drawing depicts side A as output direction. The dimensions of any other direction are obtained by a virtual turning of the connector housing around the Z axis.

### 2 Motor version

- Tachofeedback and second shaft end

- Tachofeedback and mounted incremental encoder

### G Incremental encoder connector

Must be ordered separately.

Name	Conn. type	Dim. G
straight conn.	INS 301	88
	INS 101	90
angle conn.	INS 351 INS 311	86

- Tachofeedback and mounted absolute encoder (see following page)

MB115-0/2

MAC 115 B	467	225	95.5
MAC 115 C	517	255	95.5
MAC 115 D	567	255	95.5

### 4 Output shaft

- plain shaft (recommended type)
- with keyway per DIN 6885 sh. 1, 8/68 edition  
(Note! balanced with entire key.)

Matching key: DIN 6885-A 10 x 8 x 50  
Must be ordered separately.

### 5 Special centering diameter

- $\varnothing 180 \text{ j6}$

### 6 Blower arrangement

Looking towards motor shaft.

MB115-1rad/3

Fig 8.16: Dimensional data - MAC 115 - available options - (radial cooling)

## 8.6. Dimensional data - axial cooling

- Shaft end per DIN 748 section 3, 7/75 edition, IEC 72, 1971 edition, cylindrical
- Center spigot DS M8-19 per DIN 332 section 2, 5/83 edition
- Max. tightening torque  $M_A$  for screws in the threads of the center spigot: 1Nm

- ④ Flange type per DIN 42948,  
11/65 edition, makes mounting possible
- as per design B5 (throughhole in flange)
  - as per design B14 (threads in flange)

- ⑤ **Motor power connector**  
INS 172 must be ordered separately;  
depends on motor

- Ⓡ **Tachofeedback connector:**  
Must be ordered separately.

**Ⓐ Dimensional table**

Size \ Dim.	L <sup>1)</sup>	B <sup>1)</sup>	C <sup>1)</sup>	S5 <sup>1)</sup>
MAC 115 A	433	160	65	73.5
MAC 115 B	483	210	65	73.5
MAC 115 C	533	260	65	73.5
MAC 115 D	583	310	65	73.5

1) Bigger with some options. The then applicable dimension is indicated under the respective feature.

- ② Position accuracy in terms of concentricity, excentricity and coaxiality to the shaft per DIN 42955, tolerance class N, 12/81 edition.

Table

Name	Conn. type	Dim. F
straight connector	 INS 302	123
	 INS 102	125

- 2) Straight connector with extension sleeve:  
Use part no. 218 277. This makes it possible to mount and remove the connector even if a blower shroud is present.

- Ⓜ **Blower connector: INS 195**  
Part of general delivery.

MB115-1/1

Fig 8.17: Dimensional data - MAC 115 (axial cooling)

## Available options

### 1 Power connection

The output direction of the electrical power connector is selected at the time the order is placed. Possible output directions are:

- to side A
- to side B
- to the right
- to the left

The drawing depicts side A as output direction. The dimensions of any other direction are obtained by a virtual turning of the connector housing around the Z axis.

### 2 Motor type

- Tachofeedback and mounted incremental encoder

Table

Size	Dim.	L	B	C	S5	S6

	INS 172/16	16.0	1.5	206 606	220 472 <sup>3)</sup> 220 473						

<sup>1)</sup>Strain reliefs must be mounted in the conduit thread screws of the motor power connector to ensure a problem-free operation. These are not automatically delivered. The suitable strain reliefs must be ordered from Indramat using the relevant Mat.-Nr. .

<sup>2)</sup> For motor blocking brake and motor temperature monitoring.

<sup>3)</sup> Further reduction requires Mat. Nr. 220 474.

INK 607	25.0	1.5	+	31.8 ± 0.8	180	300 <sup>2)</sup>	1.73

1) For motor blocking brake and motor temperature monitoring.  
2) Service life equals 1 000 000 bending loads

Fig 9.4: Type code dependent data of the motor power cable

### 9.4.2. General data

Designation	Data
Prot. cat. transition cable to connector	IP 65
Chemical features	absolute resistance to mineral oils and greases, hydrolysis resistant, silicone and halogen free
Permissible ambient temperature range for operation and storage	-30 to + 80 °C
Cable surface	poor adhesion, prevents sticking in drag chains
Cable length	maximum 75 meters

Fig 9.5: General data of the motor power cable

<sup>1)</sup> With axial surface cooling, use straight connectors only. <sup>2)</sup> With axial surface cooling, use straight connectors with extension sleeves only (part no. 218277). <sup>3)</sup> Do not use with MAC 093 in connection with power connector INS 172, if power connector mounted towards side B.				

Fig 10.2: Available tachofeedback connectors

## 10.3. Tachofeedback Cable

### 10.3.1. Technical Data

Type designation	INK 208
Prot. cat. transition cable to conn.	IP 65
Cable diameter	8.8 ± 0.3 mm
Minimum bending radius fixed routing	40 mm
Minimum bending radius flexible routing (Service life equals 1,000,000 bend loads)	90 mm
Weight	0.103 kg/m
Permissible ambient temperature for operation and storage	-30 °C to +80 °C
Cable surface	adhesion poor, prevents sticking in drag chains
Chemical characteristics	absolute resistance to mineral oils and greases, hydrolysis resistant, silicone and halogen free
Maximum cable length	75 m

Fig 10.3: Technical data tachofeedback cable INK 208

### 10.3.2. Ready-Made Tachofeedback Cable

Order codes for ready-made tachofeedback cable	Type codes of tachofeedback connector	INDRAMAT tachofeedback cable	Type of cable end
<b>IKS 255</b>	INS 302	INK 208	INS 317
<b>IKS 256 <sup>1)</sup></b>	INS 302 with extension sleeve	INK 208	INS 317 with coupling unit for connecting matching mate INS 302
<b>IKS 261 <sup>2) 3)</sup></b>	INS 352	INK 208	INS 317
<b>IKS 251</b>	INS 302	INK 208	
<b>IKS 252 <sup>1)</sup></b>	INS 302 with extension sleeve	INK 208	with ferrules for connecting to terminal strip of drive controller
<b>IKS 259 <sup>2) 3)</sup></b>	INS 352	INK 208	

1) with MAC 112 and 115 with axial surface cooling  
 2) do not use in motors with axial surface cooling  
 3) do not use in MAC 093 together with INS 172 and mounting orientation side B

MZFEEDBACK

Fig 10.4: Ready-made feedback cable

### 10.3.3. Order guidelines

Example: IKS 255 / 12.0

length in meters

The ready-made cables are available in increments of 0.5 meters from five meters. Shorter lengths available upon request.

# 11. Electrical Connection Incremental Encoder

## 11.1. Terminal Diagram

Encoder with square-wave pulse

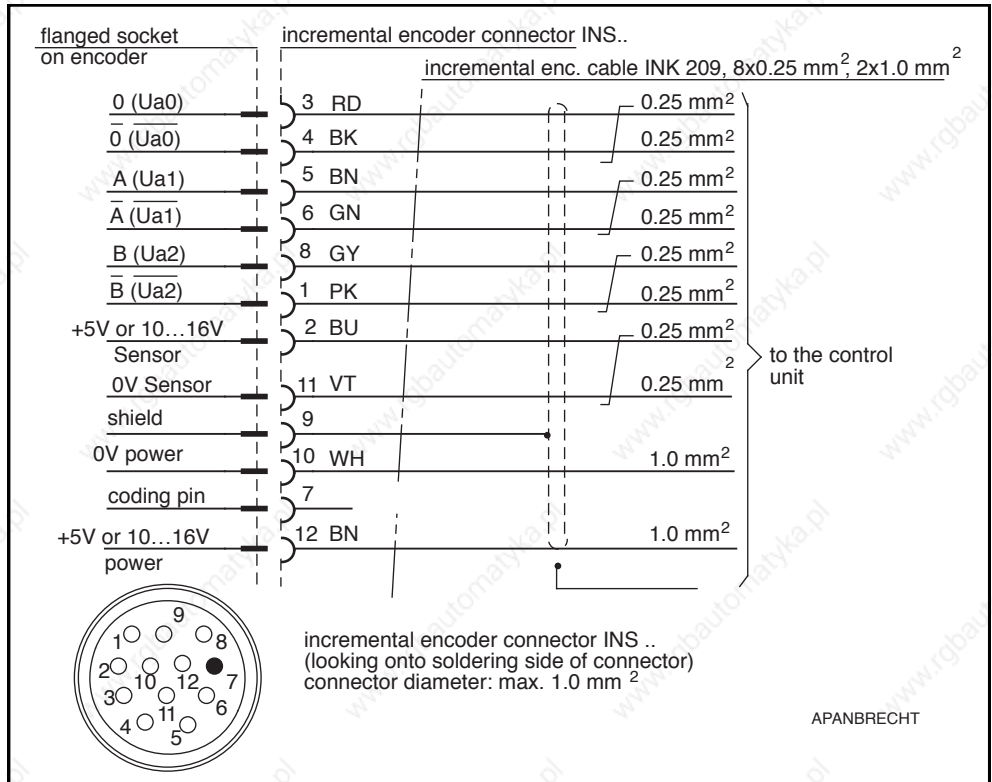

Fig 11.1: Incremental encoder terminal diagram - 5V and 10-16V, square-wave pulse

Encoder with sinusoidal signal

Fig 11.2: Incremental encoder - terminal diagram - sinus signals

## 11.2. Incremental Encoder Connector

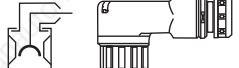

Mototyp MAC...	Types of connectors for INDRAMAT cable INK 209		Connector types suitable for Heidenhain cable or cable with external diameter ...	
	straight connector	angle connector	(...6.5 - 9.5 mm) straight connector	(...7.0 - 10.5 mm) angle connector
063... 071... <sup>1)</sup> 090... <sup>1)</sup> 093... <sup>1)</sup> 112... <sup>2)</sup> 115... <sup>2)</sup>	INS 301 	INS 351 	INS 101 	INS 311 
<sup>1)</sup> With axial surface cooling use straight connector only. <sup>2)</sup> With axial surface cooling use straight connector with extension sleeve only (part no. 218277).				

Fig 11.3: Available incremental encoder connectors

## 11.3. Incremental Encoder Cable

### 11.3.1. Technical Data

INDRAMAT cable

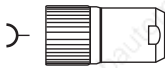

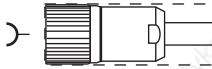

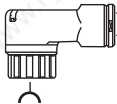

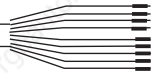

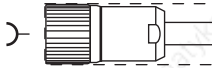

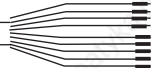

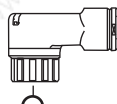

Type designation	INK 209
Prot. cat. transition cable to conn.	IP 65
Cable diameter	8.8 ± 0.3 mm
Minimum bending radius fixed routing	40 mm
Minimum bending radius flexible routing (Service life equals 1,000,000 bend loads)	90 mm
Weight	0.102 kg/m
Permissible ambient temperature for operation and storage	-30 °C to +80 °C
Cable surface	adhesion poor, prevents sticking in drag chains
Chemical characteristics	resistant to mineral oils and greases, hydrolysis resistant, silicone and halogen free
Maximum cable length	50 m

Fig 11.4: Technical data - incremental encoder cable - INK 209

Heidenhain cable

For technical data on the Heidenhain cable, please see the Heidenhain documentation. Maximum cable length equals 50 meters.

### 11.3.2. Ready-Made Incremental Encoder Cable for Encoders with Square-Wave Pulses

Order code for ready-made incremental encoder cables	Type codes for incremental encoder connectors	INDRAMAT incremental encoder cable	Type of cable end
<b>IKS 303</b>		INK 209	INS 318
<b>IKS 304 <sup>1)</sup></b>	INS 301 with extension sleeve 	INK 209	INS 318 with coupling unit to connect matching connector INS 301
<b>IKS 309 <sup>2)</sup></b>	INS 351 	INK 209	INS 318
<b>IKS 301</b>	INS 301 	INK 209	
<b>IKS 302 <sup>1)</sup></b>	INS 301 with extension sleeve 	INK 209	 with ferrules for connecting to terminal strip <sup>3)</sup>
<b>IKS 307 <sup>2)</sup></b>	INS 351 	INK 209	

<sup>1)</sup> in MAC 112 and 115 with axial surface cooling  
<sup>2)</sup> do not use in motors with axial surface cooling  
<sup>3)</sup> avoid because of interference in shield

KonfiNK

Fig 11.5: Ready-made incremental encoder cable for encoders with square-wave pulses

### 11.3.3. Order guidelines

Example : IKS 301 / 12.0

Length in meters

The ready-made cables are available in increments of 0.5 meters from five meters. Shorter lengths available upon request.

## 12. Electrical Connection Absolute Encoder

### 12.1. Terminal Diagram

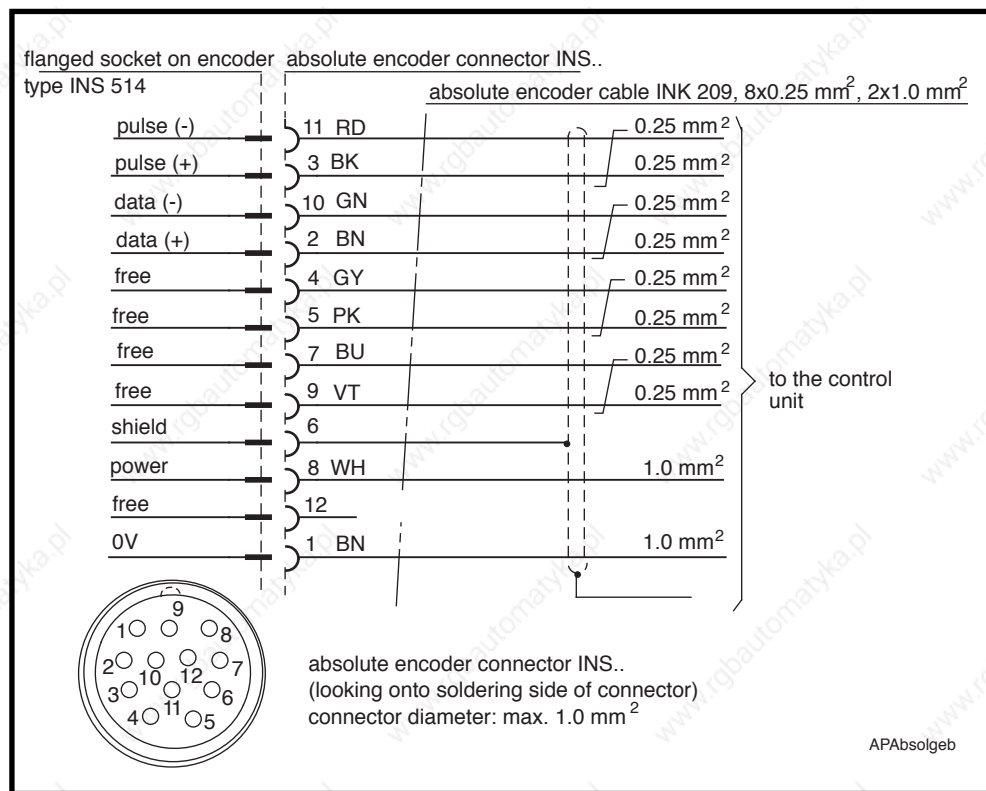

Fig 12.1: Terminal diagram - absolute encoder

### 12.2. Absolute Encoder Connector

Motor type MAC...	Types of connectors for INDRAMAT cable INK 209		Connector types suitable for cable with external diameter of 6.5 - 9.5 mm
	straight connector	angle connector	straight connector
063... 071... <sup>1)</sup> 090... <sup>1)</sup> 093... <sup>1)</sup> 112... <sup>1)</sup> 115... <sup>1)</sup>	INS 326 	INS 322 	INS 092 
<sup>1)</sup> Can be used with axial surface cooling straight connector.			

Fig 12.2: Available absolute encoder connectors

## 12.3. Absolute Encoder Cable

### 12.3.1. Technical Data

Type designation	INK 209
Prot. cat. transition cable to connector	IP 65
Cable cross section	8.8 ± 0.3 mm
Minimum bending radius fixed routing	40 mm
Minimum bending radius flexible routing (Service life equals 1,000,000 bend loads)	90 mm
Weight	0.102 kg/m
Permissible ambient temperature for operation and storage	-30 °C to +80 °C
Cable surface	adhesion poor, prevents sticking in drag chains
Chemical characteristics	resistant to mineral oils and greases, hydrolysis resistant, silicone and halogen free
Maximum cable length	100 m

Fig 12.3: Technical data absolute encoder cable INK 209

## 12.3.2. Ready-Made Absolute Encoder Cables

Order code for ready-made absolute encoder cable	Type code of absolute encoder connector	INDRAMAT absolute encoder cable	Type of cable end
IKS 724	INS 326	INK 209	INS 292
IKS 729 <sup>1)</sup>	INS 322	INK 209	INS 292
IKS 806	INS 326	INK 209	INS 327
IKS 807 <sup>1)</sup>	INS 322	INK 209	INS 327
IKS 801	INS 326	INK 209	with ferrules to connect to terminal strip <sup>2)</sup>
IKS 805 <sup>1)</sup>	INS 322	INK 209	with ferrules to connect to terminal strip <sup>2)</sup>

<sup>1)</sup> do not use in motors with axial surface cooling  
<sup>2)</sup> avoid due to interference in shield

MZFEEBACK

Fig 12.4: Ready-made absolute encoder cables

## 12.3.3. Order guidelines

Example : IKS 801 / 12.0

Length in meters

The ready-made cables are available in increments of 0.5 meters from five meters. Shorter lengths available upon request.

## 13. Guidelines on Routing Encoder Cables

Past experiences in the industry have shown that the design of an installation can be of significant importance for the interference-free transmission of encoder signals. The following should be noted with respect to the routing of the cables:

- Route the cables with shielding and separately of the load voltage lines and mains control lines.
- If the encoder cables are routed parallel to the motor cables, then maintain a minimum distance of 100 mm or equip with a metallic partition to the service cable.
- The shield of the encoder cable should be applied to the NC in the encoder connector.
- The shield may not be applied on the housing but on the motor. The encoders are insulated against the servo motor. This prevents earth loops.
- Neither pull out nor insert the connector while voltage is being applied.

Fig 13.1: Example of a metallic partition of the control cables to prevent interference from power cables.

## 14. Condition at Delivery

The motors are packed onto a palette or in cartons at the time of delivery. The way they are packed depends upon the numbers and/or sizes of the motor.

If a single motor is packed on a palette, then it is secured against sliding and movement by means of a squared timbers, and then tightly lashed into place with taut metal bands. If several motors are simultaneously delivered, then up to three motors will be on one palette. Pieces of styrofoam or cartons are then used to prevent them from damaging each other.

To prevent damage from inclement weather, a carton is palced over a palette and then affixed to the palette with the use of taut bands.

To unpack without damaging the items, simply cut through the taut bands.

**Caution! There is tension in the taut bands!**

**There exists the danger of injury from uncontrolled lashing out of the taut bands!**

**Maintain sufficient distance! Cut taugt bands open carefully!**

There is an envelope containing the delivery slip attached to the carton.

There is also a barcode sticker, or stickers depending on the extent of the delivery, listing the following information:

- type designation of the motor
- customer
- delivery slip number
- consignment
- name of delivering agent

For additional information, please see section 15, "Identifying the Merchandise".

There is no further documentation accompanying the delivery unless specifically requested.

## 15. Identifying the Merchandise

Only one delivery slip accompanies the entire delivery. This slip lists the merchandise in terms of its name and order designations. In the event that some of the listed items are distributed over several cartons or transport containers, then this will be noted in the delivery or freight slip.

### Barcode Sticker

There is a barcode sticker on the packaging of the motor. If several motors are in one carton or container, then there is a sticker for each motor.

The sticker helps to identify the contents of the cartons and is required to complete the order procedure at Indramat.

The following information is on the sticker:

- type designation of the motor
- customer
- delivery slip number
- consignment
- name of the delivering agent

Fig 15.1: An example of a barcode sticker

**Rating Plate** The motor is delivered with a rating plate which is attached to the motor housing.

If a second rating plate is ordered, then it is placed over the original one with double-sided tape. Both are on the housing of the motor.

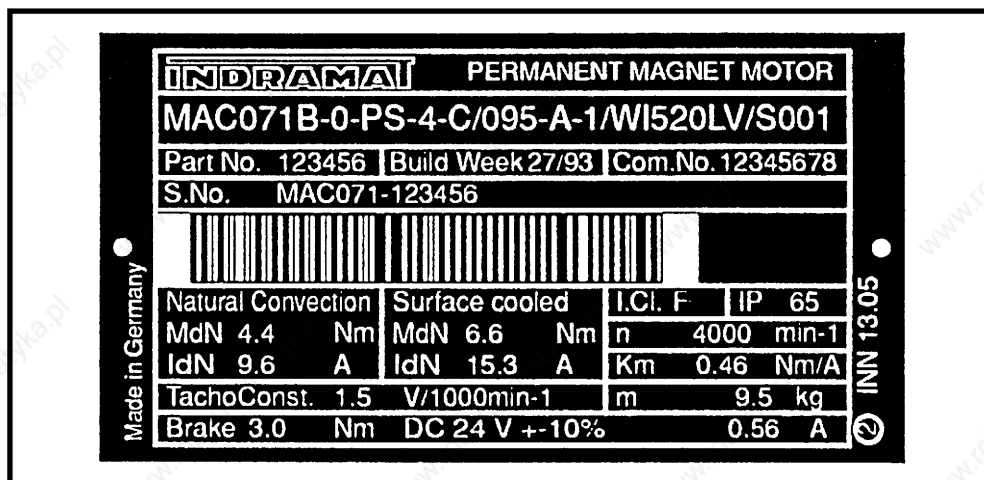

Fig 15.2: Example of a rating plate of a MAC AC servo motor per DIN 42961

## 16. Storage, Transport and Handling

There are guidelines on storage and transportation printed on the carton. These must be followed.

Fig 16.1: Guidelines on storage and transport on packaging

### Storing the Motors

The motors must be stored in a dry, dust-free and shock-free environment.

Permissible ambient temperature range: -25 °C to + 85 °C.

There are protective covers on the connector housing as well as the output shaft. These are made of plastic and protect the parts they cover against moisture and damage. Do not remove the protective covers until shortly prior to mounting into the machine.

### Transport and Handling

Avoid impacts to the output shaft and heavy loads as otherwise the bearings in the motor could be damaged.

Note the different weights and sizes of the individual types of motors when selecting both the transport and lifting devices.

**Do not pick up the motor at the blower. This will damage and possibly tear the blower off of the motor housing.**

Figure 16.2 depicts how the heavy motors should be picked up with the help of a crane and belts. It is important that no load be applied to either output shaft or blower housing during this procedure!

Fig 16.2: Picking up and transporting the motors with the help of the crane belts

There are two M8 tapped holes in the housing of the MAC 112 and MAC 115 line of motors. Lifting screws, per DIN 580, can be screwed into place here. These can then be used for holding the motor in place by a suitable lifting device. The hooks of a chain tackle can, for example, be hooked into place here. See Figure 16.3 for illustration.

INDRAMAT does not automatically deliver these lifting hooks with the motor. The user must, therefore, supply them.

**If an axial surface cooling blower is mounted to MAC 112 or 115 motors, then these may only be picked up by the lifting hooks.**

Fig 16.3: Picking up and transporting the MAC 112 and 115 series with chain tackle

## 17. Mounting and Installation Guidelines

The following guidelines must be followed to avoid damaging the machine when mounting or commissioning:

- The bigger and thus heavier motors may only be transported with the use of suitable lifting devices as described in the guidelines of section 16.
- Avoid impacts to the output shaft and heavy loads at the shaft as otherwise the bearings within the motor could be damaged.
- The motors should only be mounted to the machine by fully trained personnel.
- The spigot nuts on the connectors, e.g., motor power and feedback connectors, must be tightly screwed into place when connecting.
- The motor must be grounded to the drive amplifier.
- The terminal diagrams of the machine manufacturer should be followed when wiring the motor!
- Check the reference point settings when replacing motors (see section 2.4, "Motor feedback").
- The guidelines on cable routing are outlined in section 1.3.
- The guidelines on connecting the motor blower are outlined in section 2.3.

## 18. Service Notes

### 18.1. Contacting Customer Service

INDRAMAT customer service can be contacted at the following Service Hotline numbers during the times listed:

Service Hotline      Phone number: 0172-6600406 or 0171-3338826

Monday - Friday      7.00 a.m. to 11.00 p.m. MET

Saturday      8.00 a.m. to 8.00 p.m. MET

Sundays and holidays 9.00 a.m. to 7.00 p.m. MET

We would appreciate your noting the following information prior to contacting Indramat customer service:

- type data of motor and drive
- the problem
- all fault and diagnostics displays

This will make it possible to quickly and definitively locate the problem.

When returning a motor, please include a copy of the repair card on the next page. Fill it out and send it in. This will enable us to locate the problem caused by their particular application.

## 18.2. Repair Card

Fig 18.1: Repair card

## 19. Index

### A

Absolute Encoder 34  
Absolute Encoder Cable 177  
Absolute Encoder Connector 176  
Ambient mechanical conditions 14  
Ambient temperatures 12  
Angle connector 21  
Applications 7  
Axial surface cooling 17

### B

Barcodesticker 181

### C

Centering / pilot diameter 16  
Condition at Delivery 180  
Connection Incremental Encoder 173  
Connection Tachofeedback 170  
Connector-Cable Allocations 156  
Construction 15  
Cooling 10, 17

### E

Electrical Connection Absolute Encoder 176  
Electrical connections 11  
Electrical Power Connection 155

### F

Feedback 21  
Feedback connection 23

### G

Guidelines on Cable Routing 179

### H

Holding brake 11, 19  
Housing coat 15  
How to order 169

### I

Identifying the Merchandise 181  
Incremental Encoder Cable 174  
Incremental Encoder Connector 174  
Incremental Encoders 28  
Installation 10  
Installation elevation 12

### L

Limiting value for speed 39  
Limiting value for torque 39

### M

MAC 063 42  
MAC 071 59

MAC 090 80  
MAC 093 97  
MAC 112 118  
MAC 115 137  
Motor 25  
Motor blower connection 23  
Motor feedback 9  
Motor Power Cable 163  
Motor Power Connector 162  
Motor power connectors 23  
Mounted Encoder 27  
Mounted encoder 9  
Mounting and Installation Guidelines 186  
Mounting orientation 15  
Mounting the absolute encoder 37

## O

Operating reliability 10  
Output shaft 11, 16  
Output shaft with keyway 16

## P

Performance data 10  
Permissible shaft load 17  
Plain output shaft 16  
Power connection 20, 23  
Power levels 8  
Protection category 12

## R

Radial surface cooling 18  
Rating Plate 182  
Ready-Made Absolute Encoder Cables 178  
Ready-Made Incremental Encoder Cable for Encoders with Square-Wave Pulses 175  
Ready-Made Motor Power Cables 164  
Ready-Made Tachofeedback Cable 172  
Repair Report Card 188  
Replacing the encoder 36

## S

Second Shaft End 26  
Service Notes 187  
Service-Hotline 187  
Setting the reference point 32  
Setting the reference point of the absolute encoder 38  
Shaft sealing 17  
Smooth run qualities 11  
Storage, Transport and Handling 183  
Straight connector 21  
Structure 9

## T

Tachofeedback 9, 25, 26  
Tachofeedback Cable 171  
Tachofeedback Connector 170
