RECORD OF REVISION

CRAY RESEARCH, INC.

PUBLICATION NUMBER T-0103

Each time this manual is revised and reprinted, all changes issued against the previous version in the form of change packets are incorporated into the new version and the new version is assigned an alphabetic level. Between reprints, changes may be issued against the current version in the form of change packets. Each change packet is assigned a numeric designator, starting with 01 for the first change packet of each revision level.

Every page changed by a reprint or by a change packet has the revision level and change packet number in the lower righthand corner. Changes to part of a page are noted by a change bar along the margin of the page. A change bar in the margin opposite the page number indicates that the entire page is new; a dot in the same place indicates that information has been moved from one page to another, but has not otherwise changed.

Requests for copies of Cray Research, Inc. publications and comments about these publications should be directed to:

CRAY RESEARCH, INC.,

Mendota Heights, Minnesota 55120

Revision	Description
	December, 1979 - Original printing.
A	June, 1980 - obsoletes other revision.
B	January, 1981 - obsoletes other revisions.
C	September, 1981 - obsoletes other revisions. Supports 1.10 release.

OVERVIEW OF CRAY-1 OPERATING SYSTEM (COS)

CRAY-1 OPERATING SYSTEM (COS)

- MULTIPROGRAMMING OF USER APPLICATIONS
- SCHEDULING OF APPLICATIONS BY PRIORITY (JOB CLASS)
- MANAGES DISK AND TAPE RESOURCES
- MANAGES FRONT-END COMMUNICATIONS
- MANAGES FILE MAINTENANCE
- MANAGES PROGRAM MAINTENANCE
- CAPABLE OF MODIFICATION AT STARTUP

COS HARDWARE ELEMENTS

- MCU

  STARTUP AND RECOVERY OF COS
  FRONT-END COMPUTER SYSTEM

- MASS STORAGE SUBSYSTEM

  UTILITIES
  DATA
  LIBRARIES
  COPY OF COS (OPTIONAL)
  COS OVERLAYS (OPTIONAL)
  COPIES OF CSP (OPTIONAL)

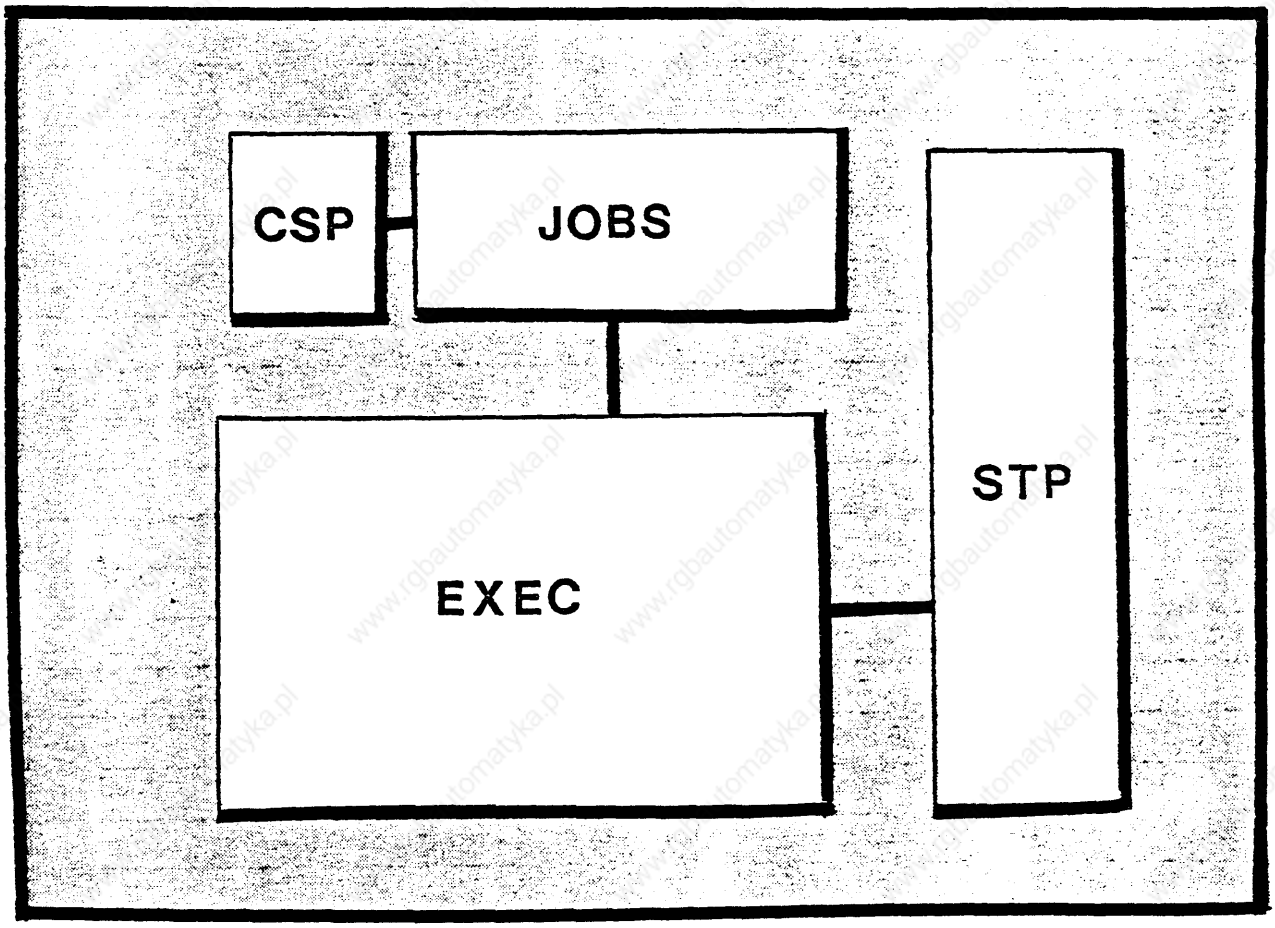
- CRAY-1 COMPUTER

  COS RESIDENT
  USER APPLICATIONS EXECUTION AREAS
  USER STATION BUFFERS

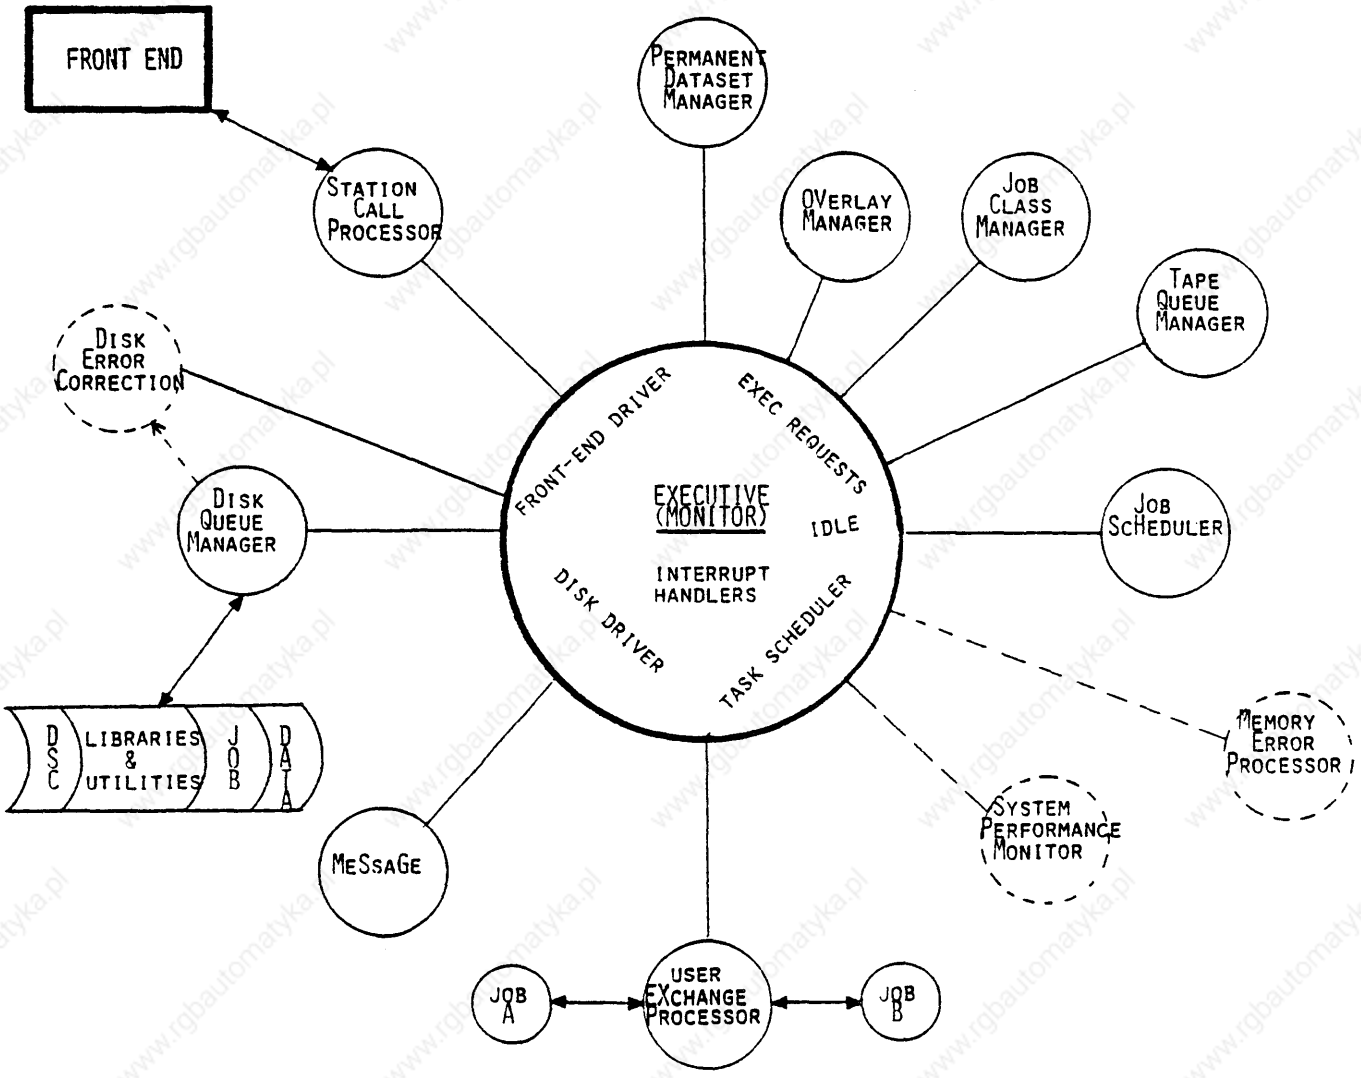
COS SOFTWARE ELEMENTS

- RESIDENT SYSTEM PROGRAMS

  EXECUTIVE (EXEC)
  SYSTEM TASK PROCESSOR (STP)
  CONTROL STATEMENT PROCESSOR (CSP) - OPTIONAL



- NON-RESIDENT PROGRAMS
  - LIBRARIES
  - SYSTEM UTILITIES
  - USER APPLICATIONS



FRONT END
STATION CALL PROCESSOR
PERMANENT DATASET MANAGER
OVERLAY MANAGER
JOB CLASS MANAGER
TAPE QUEUE MANAGER
DISK ERROR CORRECTION
DISK QUEUE MANAGER
FRONT-END DRIVER
EXEC REQUESTS
EXECUTIVE (MONITOR)
IDLE
INTERRUPT HANDLERS
DISK DRIVER
TASK SCHEDULER
JOB SCHEDULER

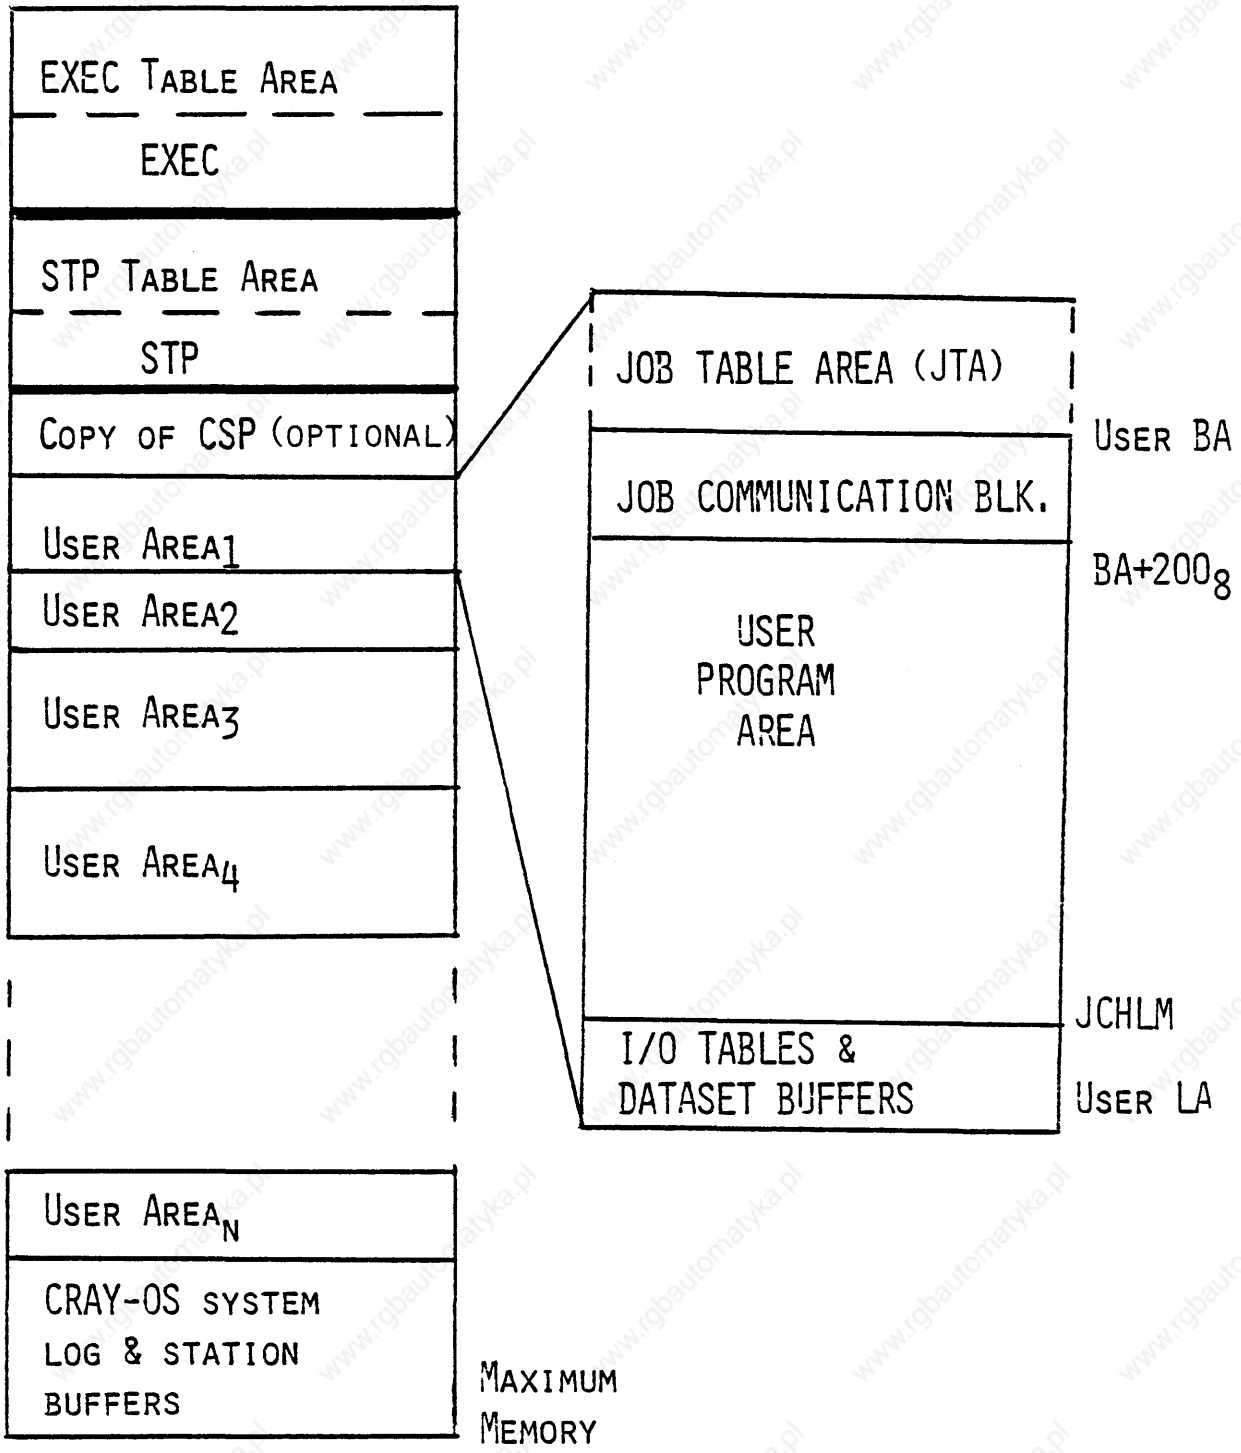
MESSAGE
MEMORY ERROR PROCESSOR
SYSTEM PERFORMANCE MONITOR
JOB A
USER EXCHANGE PROCESSOR
JOB B

SYSTEM MEMORY ASSIGNMENTS

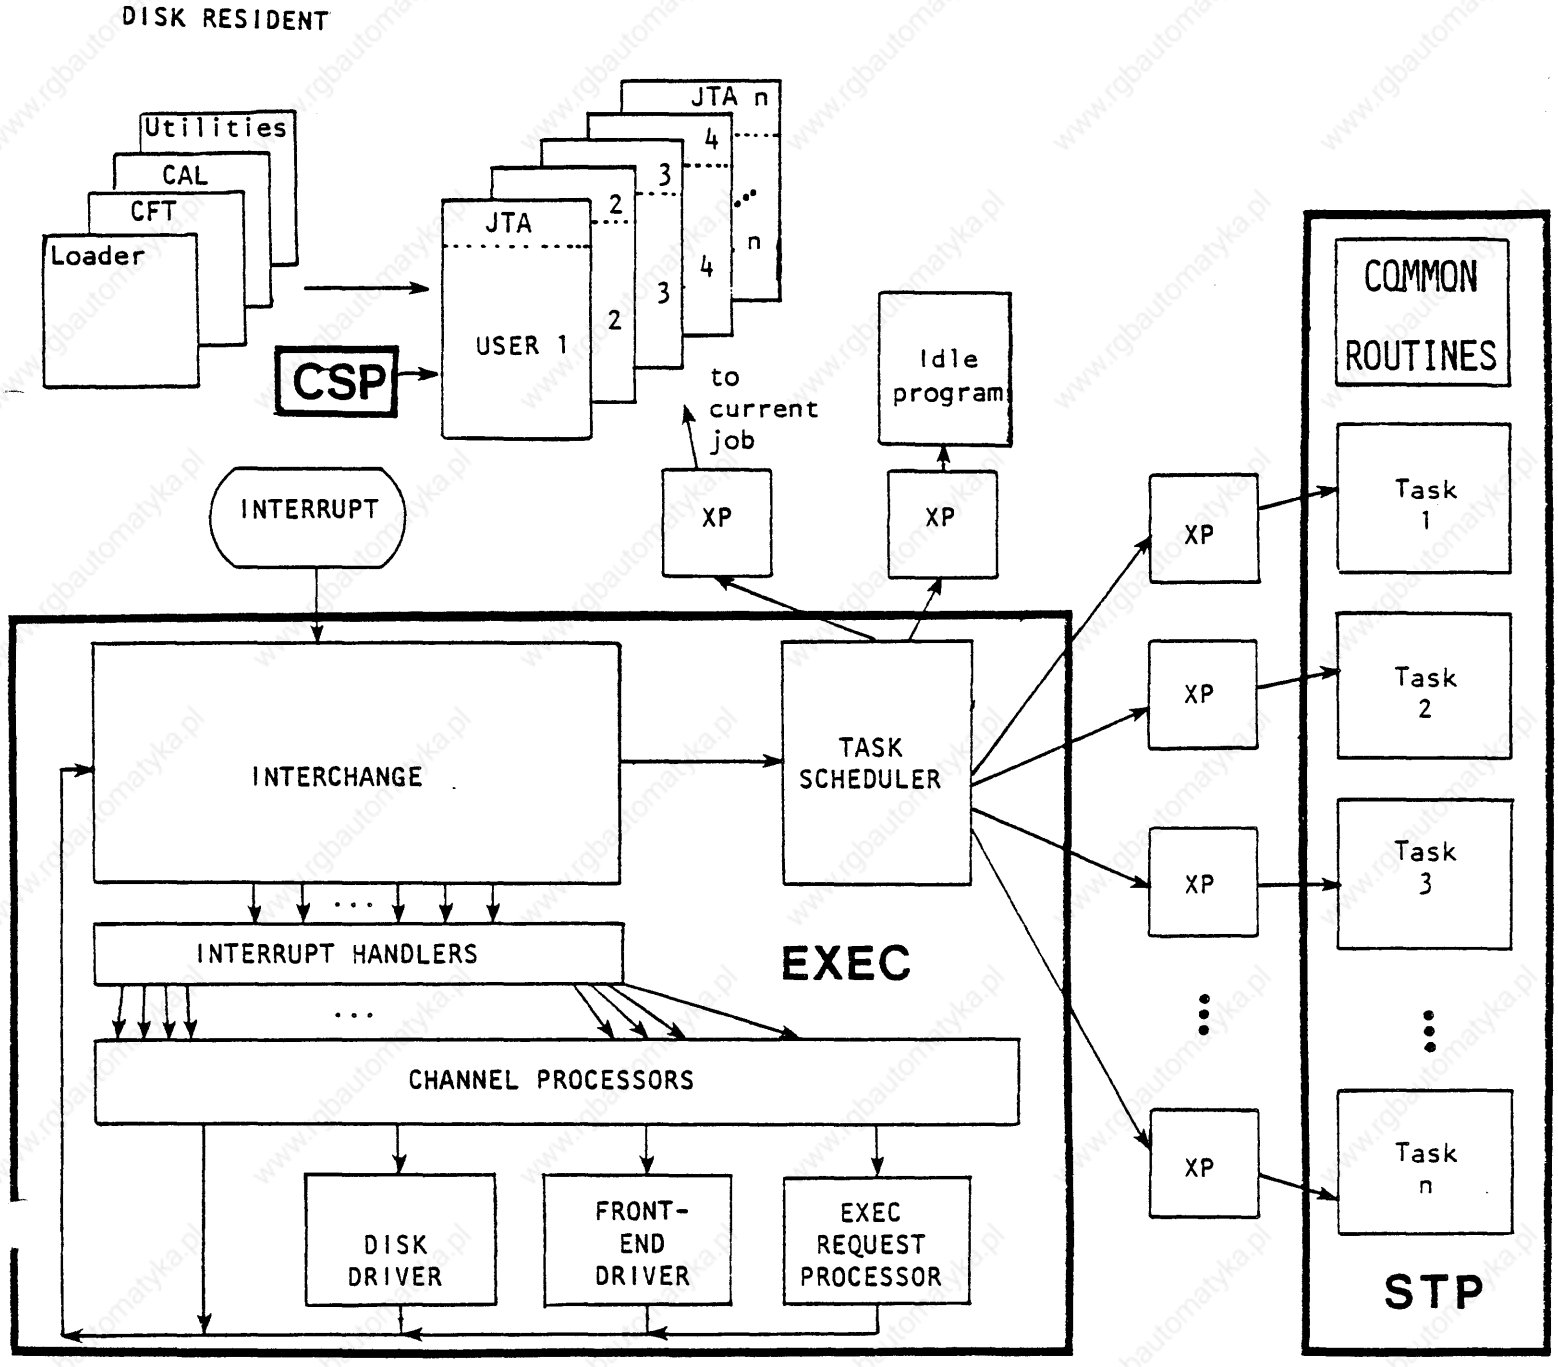


SYSTEM EXECUTIVE

www.rgbautomatyka.pl

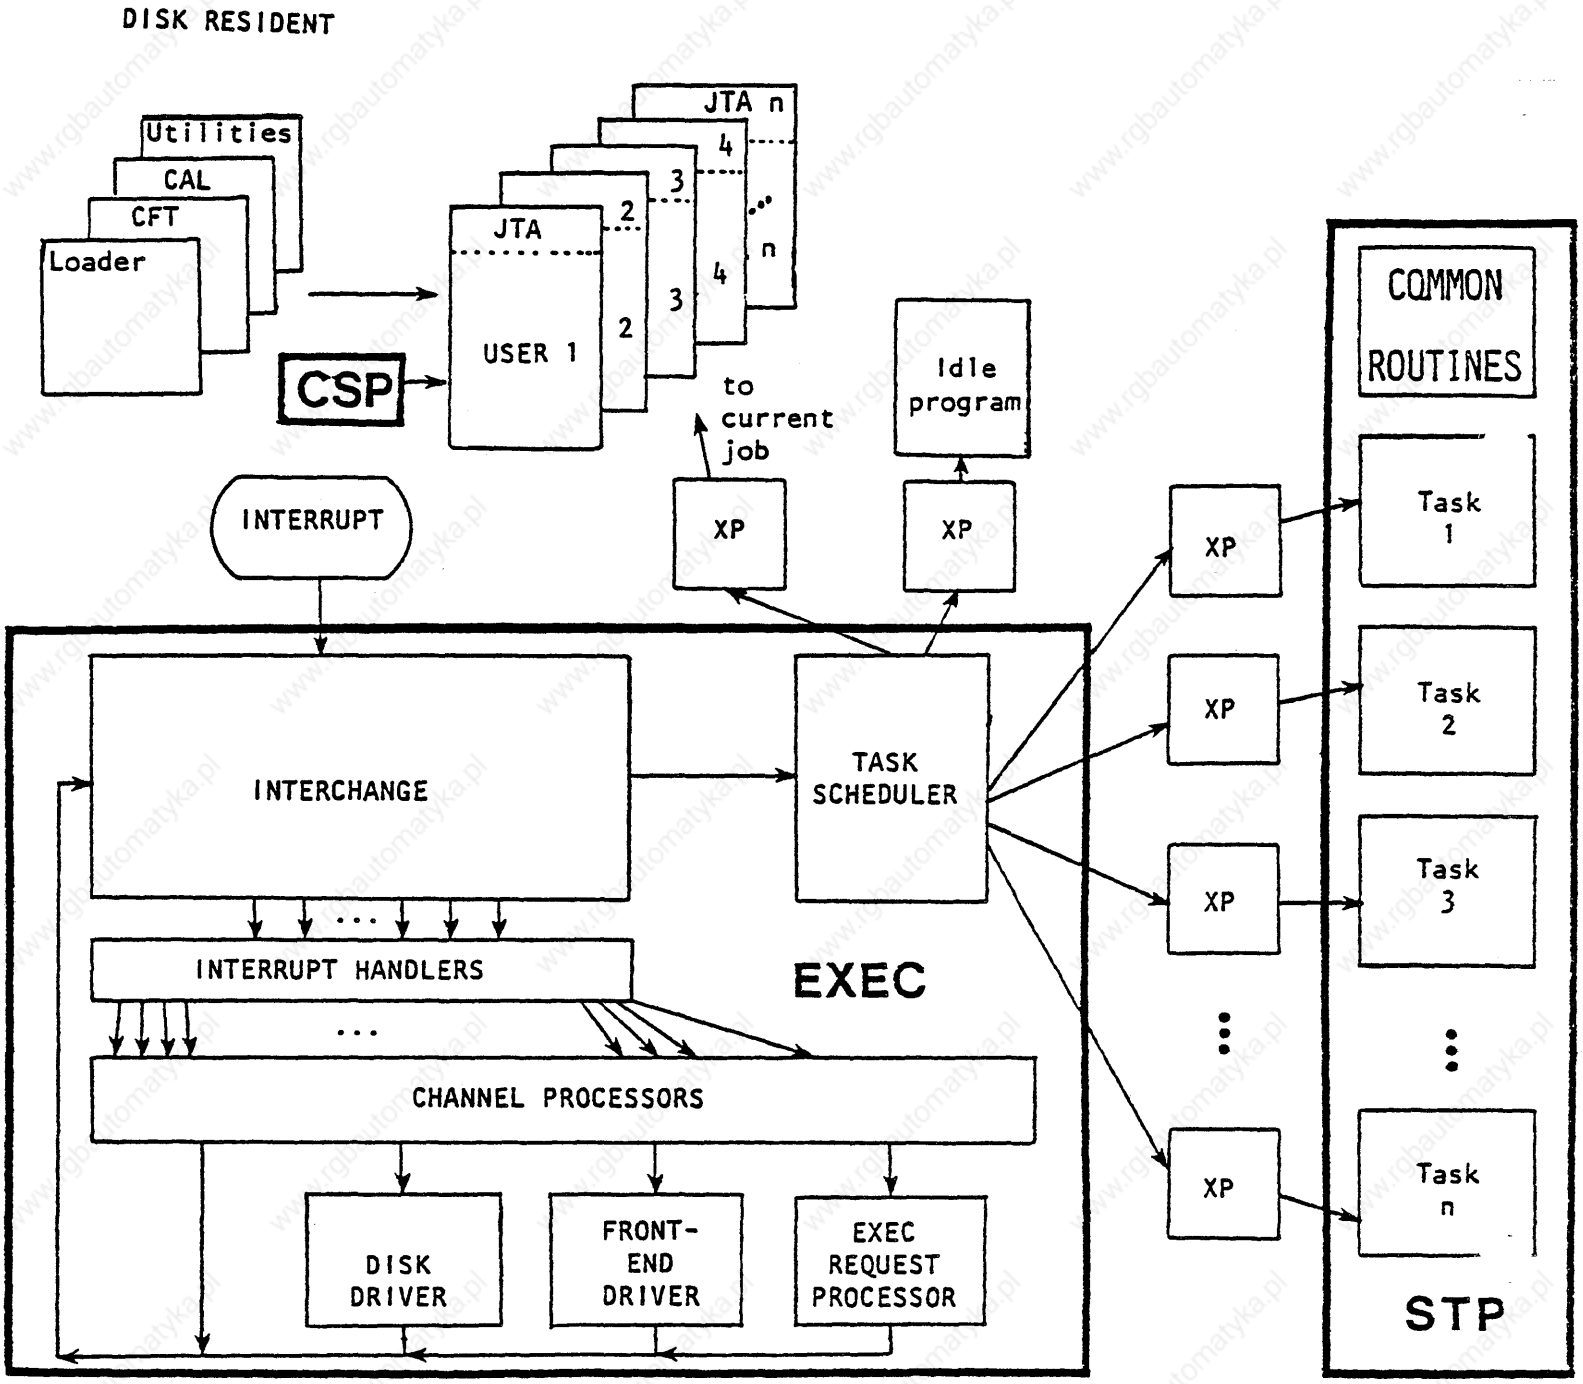
SYSTEM EXECUTIVE PROGRAM (EXEC)

- CONTROL CENTER FOR COS
- EXECUTES IN MONITOR MODE
- CAN ACCESS ALL OF MEMORY (BA=0,LA=I@MEM)



SYSTEM EXECUTIVE PROGRAM (EXEC)

- CONTROL CENTER FOR COS
- EXECUTES IN MONITOR MODE
- CAN ACCESS ALL OF MEMORY

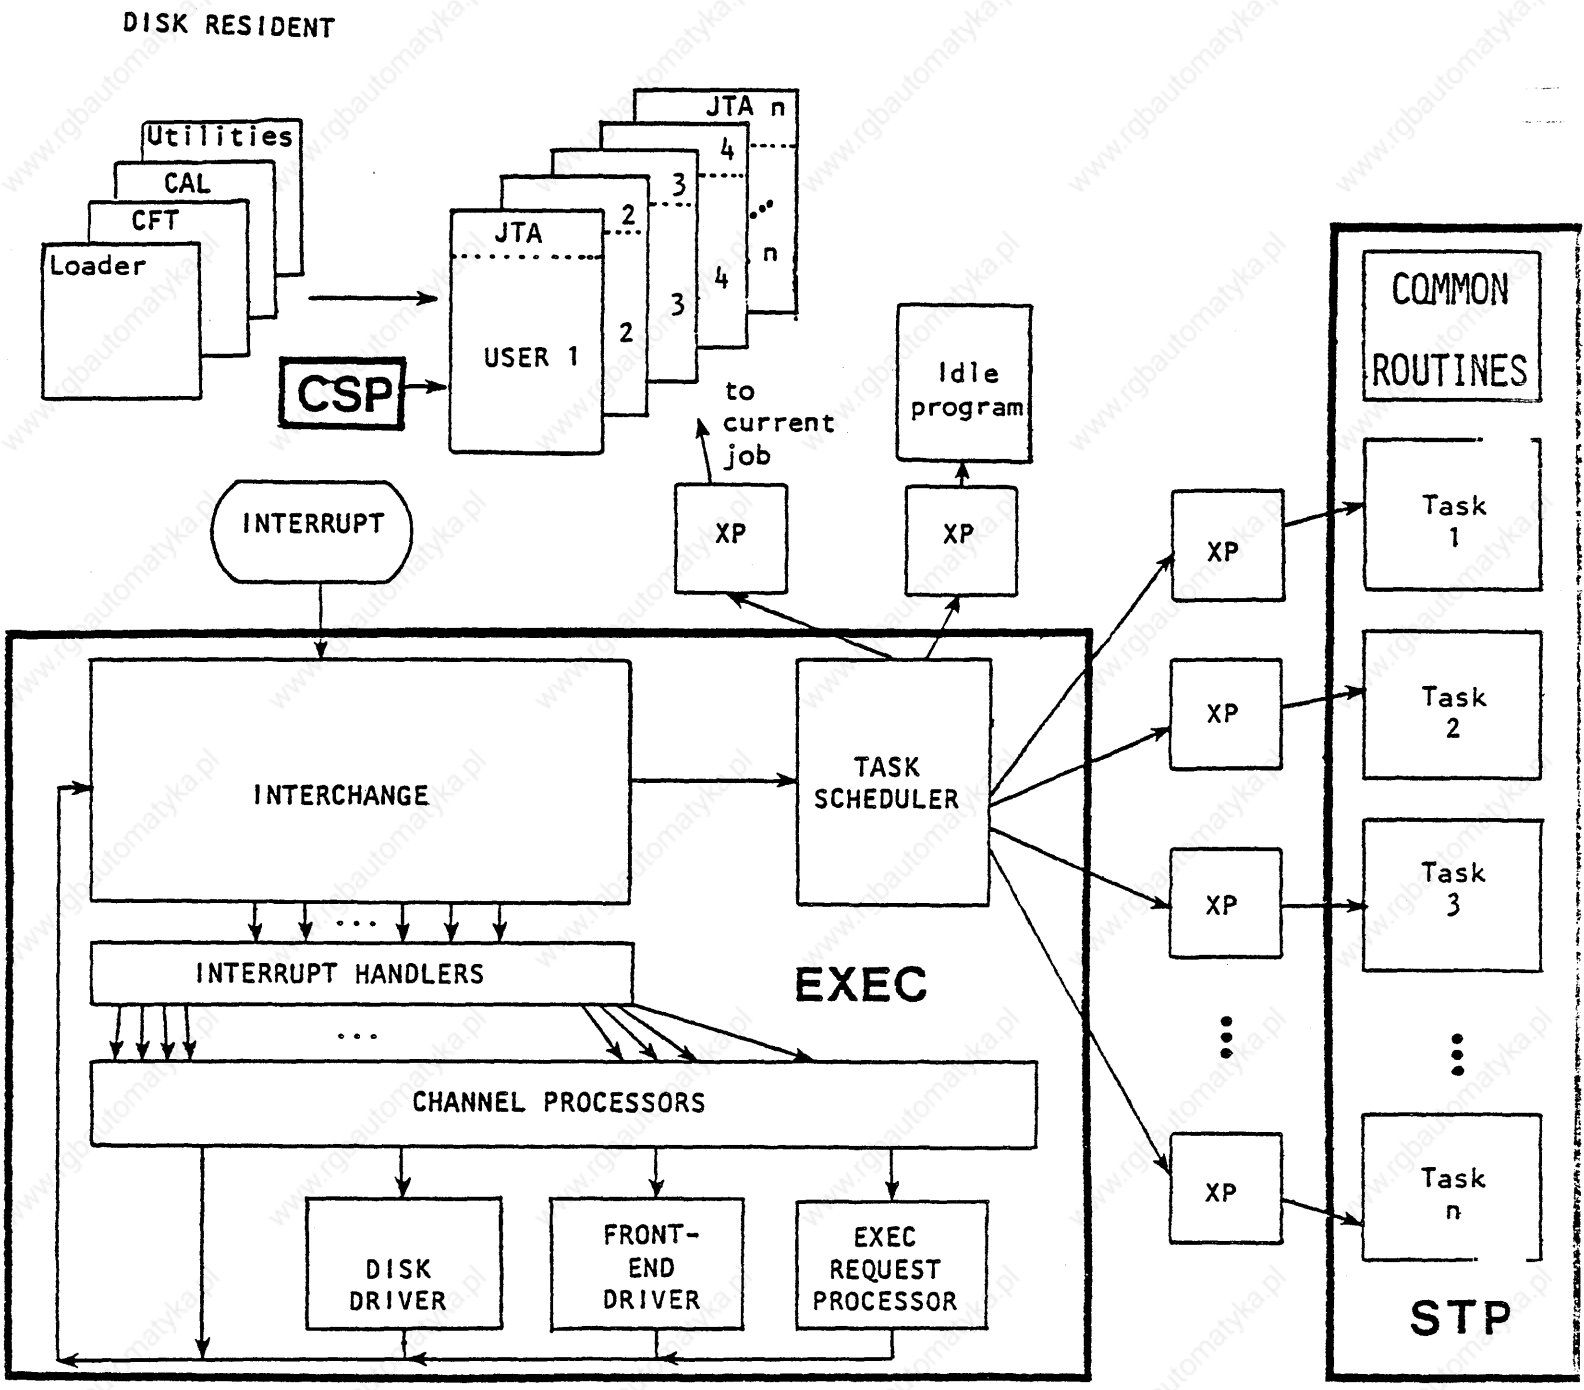


FUNCTIONS OF EXEC

- INTERCHANGE ANALYSIS
- INTERRUPT HANDLERS
- CHANNEL MANAGEMENT
- TASK SCHEDULER
- EXECUTIVE REQUEST PROCESSOR
- DISK DRIVER
- FRONT-END DRIVER

SYSTEM EXECUTIVE PROGRAM (EXEC)

- CONTROL CENTER FOR COS
- EXECUTES IN MONITOR MODE Non Interruptable
- CAN ACCESS ALL OF MEMORY



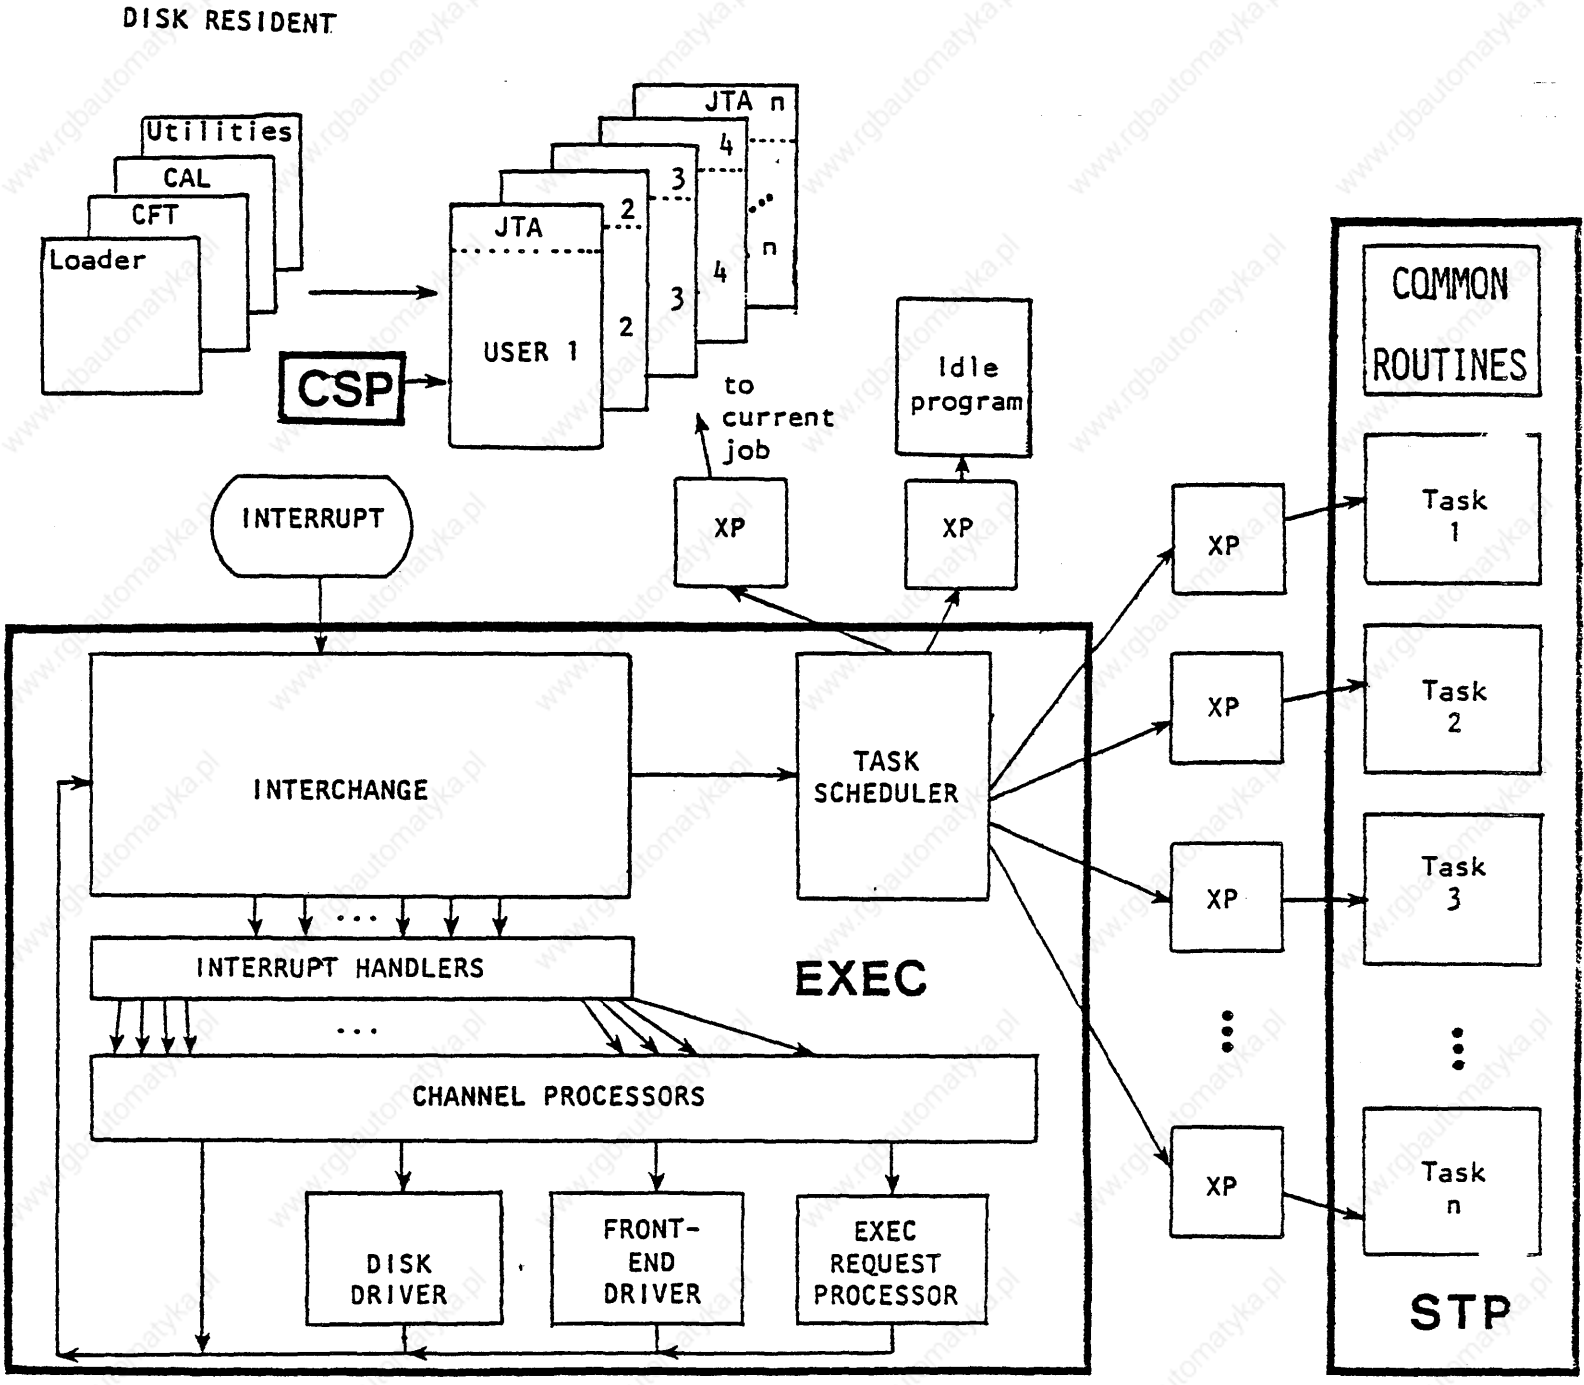
INTERCHANGE

- SAVES CURRENT RTC
- UPDATES ACCRUED CPU TIME
- CALLS I/O HANDLER IF I/O INTERRUPT
- SENSES FOR LOST HARDWARE INTERRUPTS OF PREVIOUS DISK I/O INSTRUCTIONS
- CALLS INTERRUPT HANDLERS FOR:

  CONSOLE / I/O interrupt
  REAL TIME CLOCK
  ERROR EXIT
  NORMAL EXIT
  MEMORY ERROR EXIT
  [illegible] clock
  floating point err
  Prog range err
  Operand range err

SYSTEM EXECUTIVE PROGRAM (EXEC)

- CONTROL CENTER FOR COS
- EXECUTES IN MONITOR MODE
- CAN ACCESS ALL OF MEMORY



INTERRUPT HANDLERS

- EXECUTE ONE OF THE FOLLOWING INTERRUPT HANDLERS:

IOI	I/O INTERRUPT HANDLER
CII	CONSOLE INTERRUPT HANDLER
RTI	REAL-TIME INTERRUPT HANDLER
NEI	NORMAL EXIT INTERRUPT HANDLER
EEI	ERROR EXIT INTERRUPT HANDLER
MEI	MEMORY ERROR INTERRUPT HANDLER
PCI	Programmable Clock Int. Handler.

Not Used

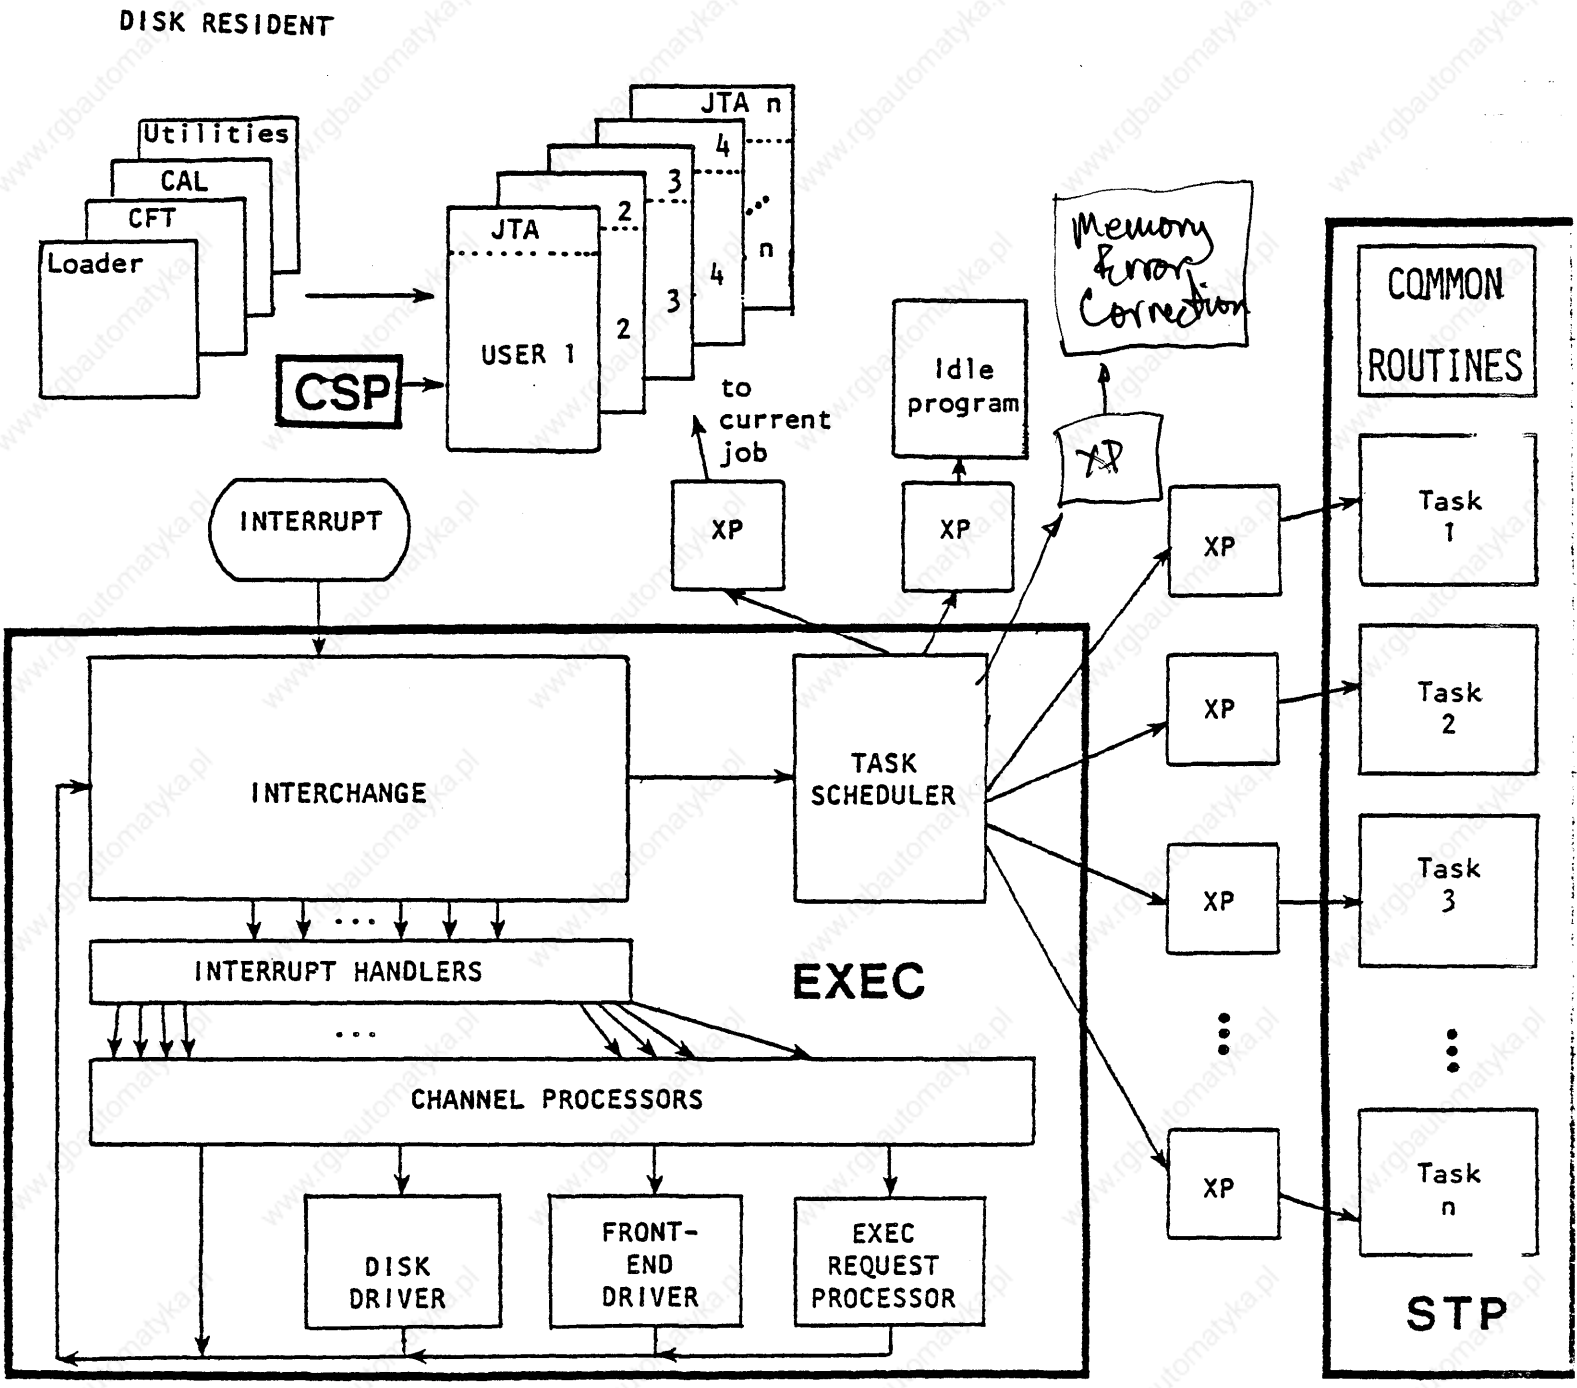
- CLEAR THE INTERRUPT FLAG IN THE EXCHANGE PACKAGE OF THE INTERRUPTED PROGRAM

- DETERMINE THE CHANNEL ON WHICH THE INTERRUPT OCCURED

- BRANCH TO THE APPROPRIATE CHANNEL PROCESSOR

SYSTEM EXECUTIVE PROGRAM (EXEC)

- CONTROL CENTER FOR COS
- EXECUTES IN MONITOR MODE
- CAN ACCESS ALL OF MEMORY



CHANNEL PROCESSORS

- CHANNEL PAIRS ARE ASSIGNED NUMBERS AS FOLLOWS:

0	CONSOLE
1	~~MCU CLOCK~~
2	12 I/O CHANNELS
4	
6	
.	
.	
.	
24	
26	NORMAL EXIT PSEUDO CHANNEL
28	ERROR EXIT PSEUDO CHANNEL
30	PROGRAMMABLE CLOCK PSEUDO CHANNEL
32	MEMORY ERROR PSEUDO CHANNEL

- CHANNEL PROCESSOR TABLE (CHT) HAS ENTRIES FOR BOTH THE INPUT AND OUTPUT SIDES OF EACH CHANNEL

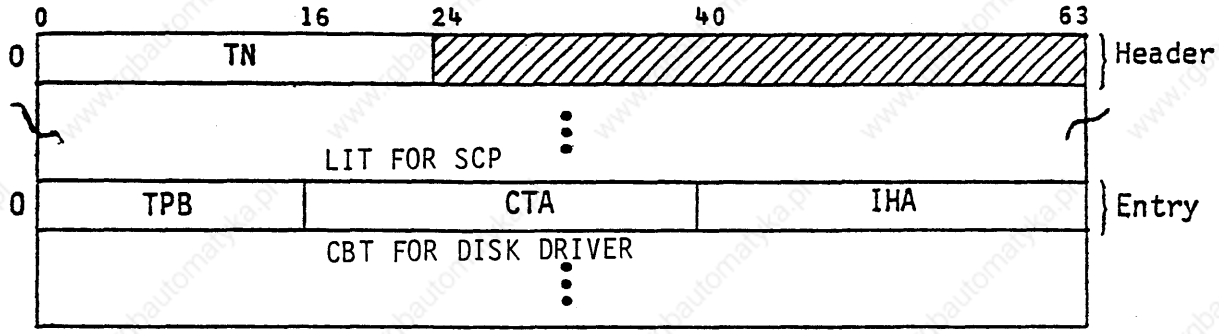
- CHT POINTS TO THE INTERRUPT PROCESSOR

- CHT POINTS TO A PARAMETER AREA FOR EACH CHANNEL PROCESSOR

- CHT POINTS TO CONTROL TABLE ADDRESS

CHANNEL TABLE - CHT

The Channel Table resides in EXEC memory and contains information for use by the interrupt handlers. There is one entry for each channel, physical or pseudo.



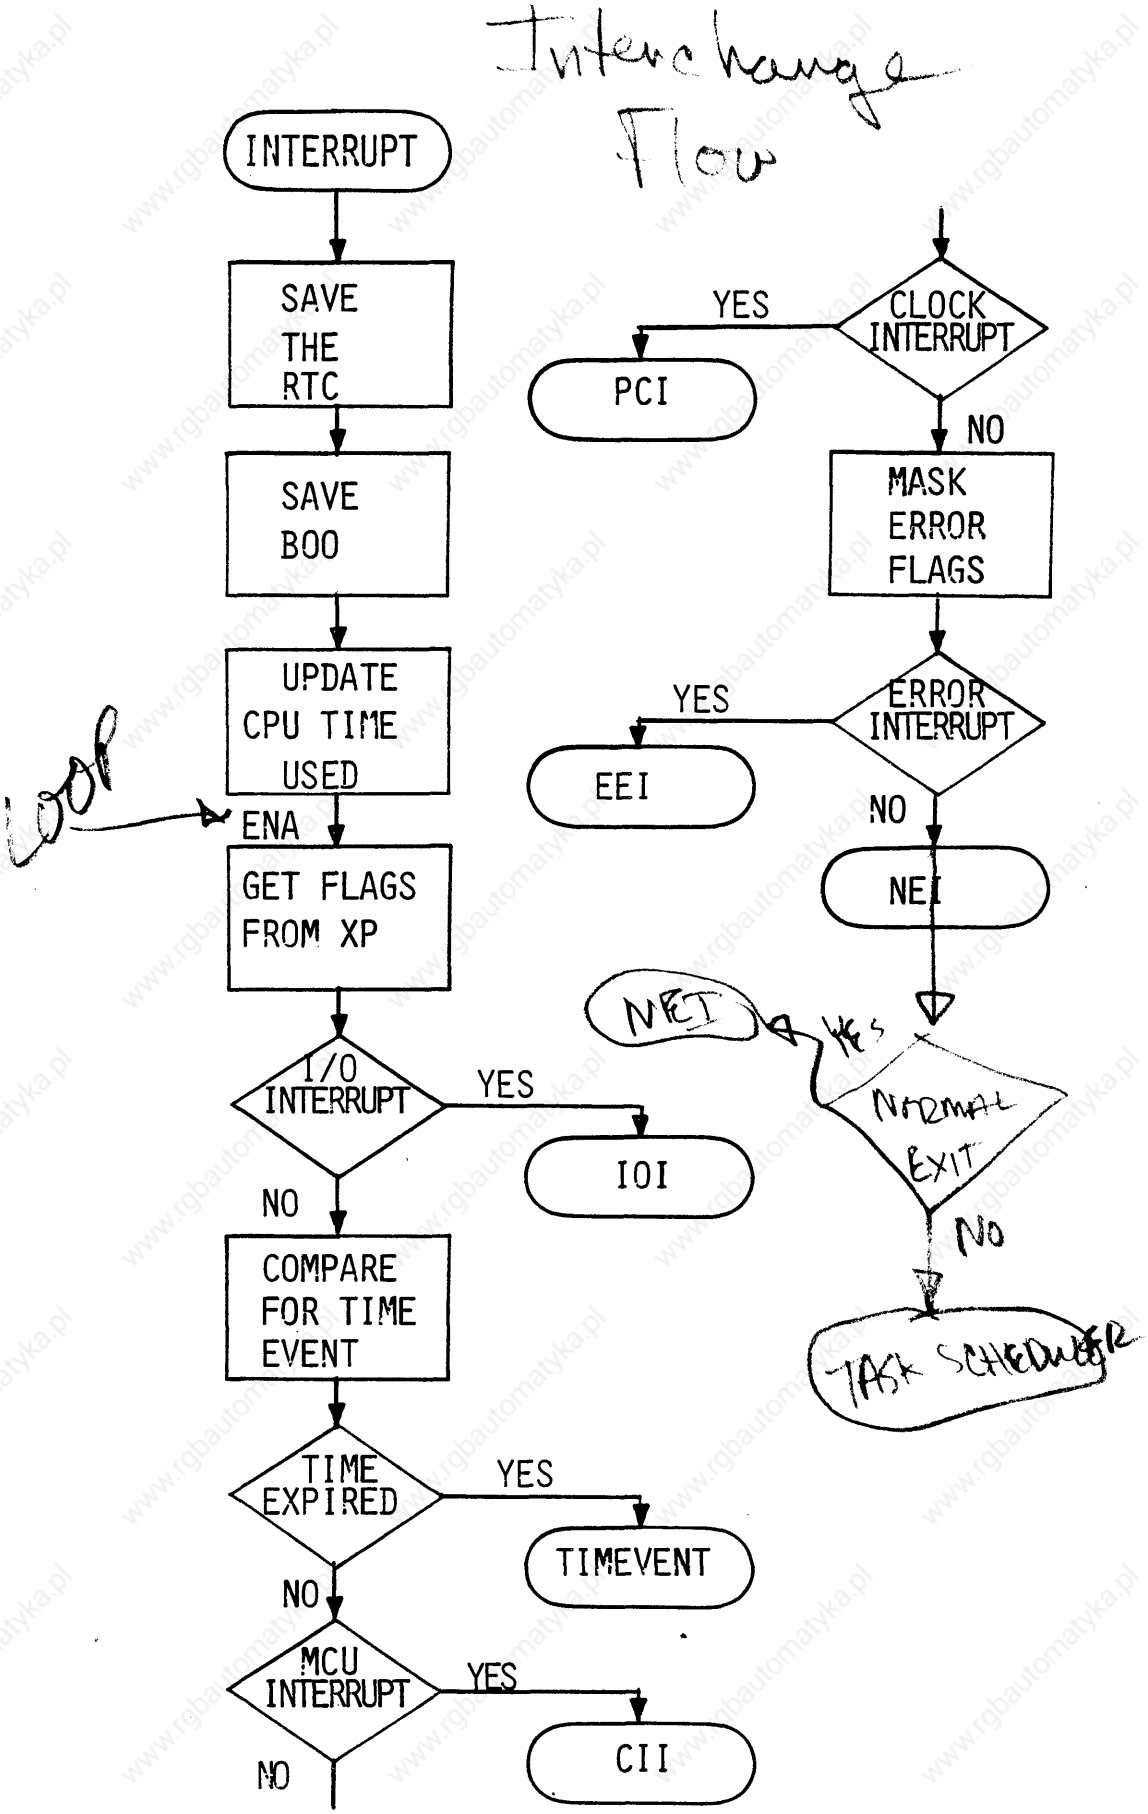
HEADER

Field	Word	Bits	Description
CHTN	0	0-23	Table name; "CHT" in ASCII

ENTRY

Field	Word	Bits	Description
CHTPB	0	0-15	Address of task parameter word
CHCTA	0	16-39	Control table address
CHIHA	0	40-63	Interrupt handler address

CHANNEL PROCESSOR TABLE



Interchange Flow
INTERRUPT

INDICATE USER XP IN JTA
ENA

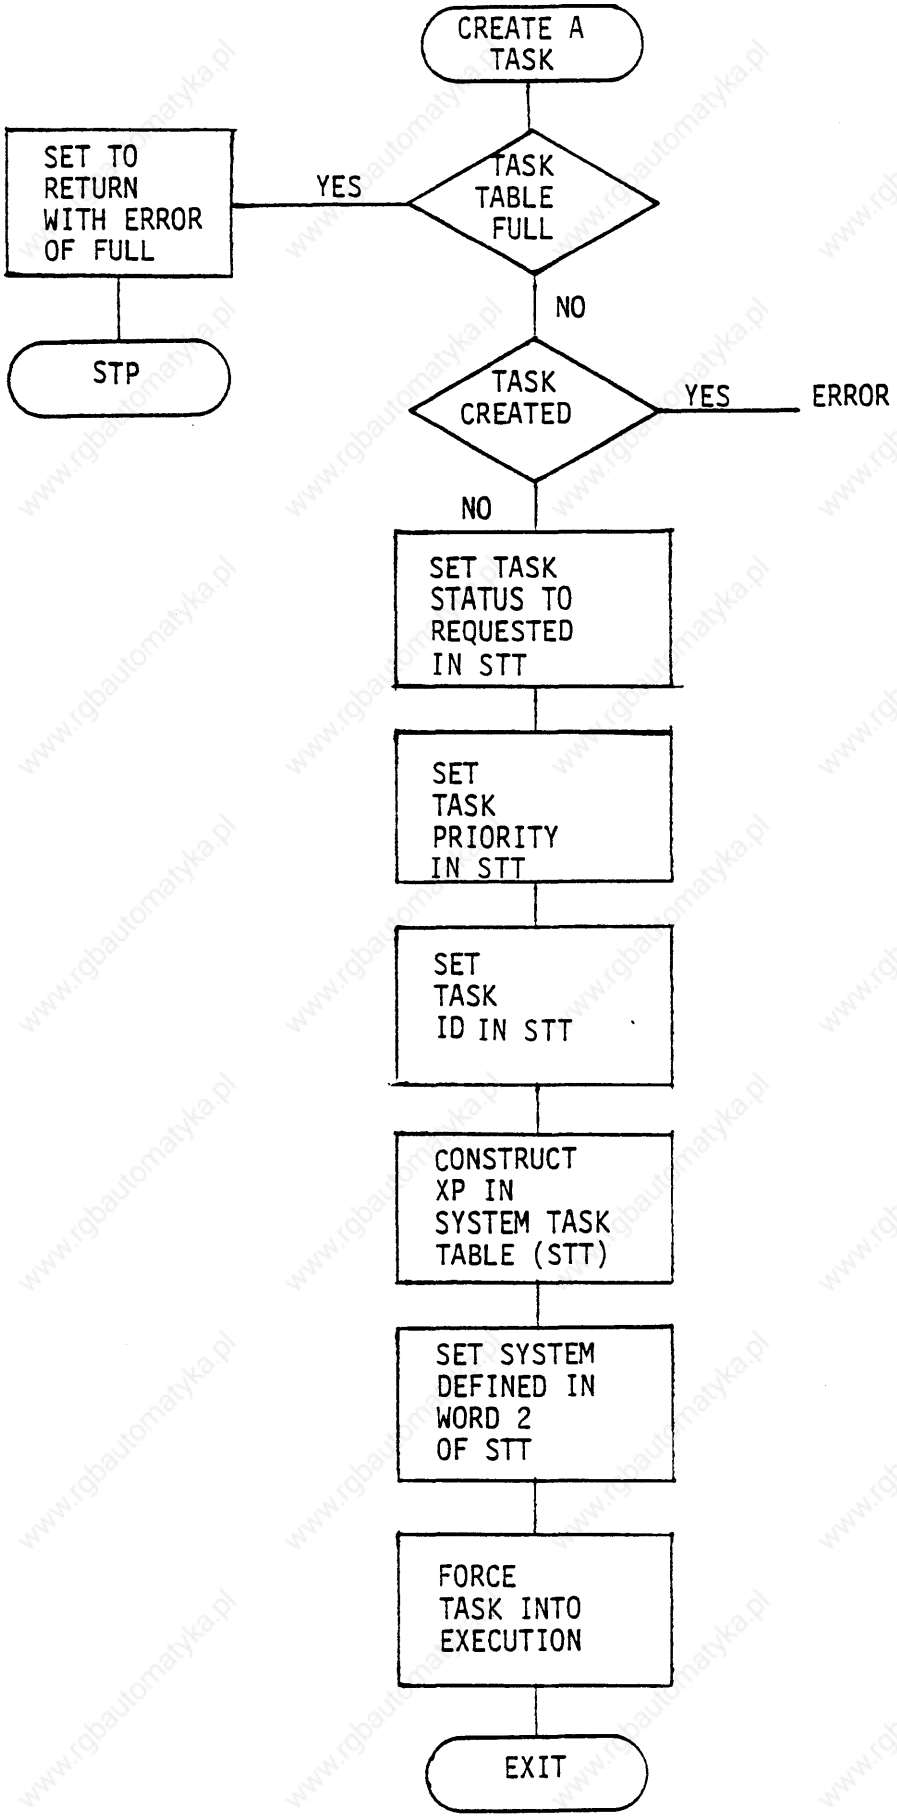
TASK REQUESTS

- THE EXECUTIVE REQUEST PROCESSOR IS INITIATED BY THE NORMAL EXIT CHANNEL PROCESSOR.

- THE REQUEST IS PASSED TO EXEC IN REGISTERS S6 AND S7

- EXECUTIVE REQUESTS ARE:

  CREATE A TASK
  READY A TASK
  SELF SUSPEND TASK
  ASSIGN CHANNEL
  STATION I/O REQUEST
  DISK BLOCK I/O REQUEST
  READY TASK AND SUSPEND SELF
  GET TIME AND DATE
  CONNECT USER JOB TO CPU
  DISCONNECT USER JOB FROM CPU
  POST A MESSAGE IN HISTORY BUFFER
  SET MEMORY SIZE
  START/STOP OPERATING SYSTEM
  DISPLAY MEMORY/EXCHANGE PACKAGE
  ENTER MEMORY/EXCHANGE PACKAGE
  SET/CLEAR SYSTEM BREAKPOINT



CREATE A TASK
TASK TABLE FULL
YES
SET TO RETURN WITH ERROR OF FULL
STP
NO
TASK CREATED
YES
ERROR
NO
SET TASK STATUS TO REQUESTED IN STT
SET TASK PRIORITY IN STT
SET TASK ID IN STT
CONSTRUCT XP IN SYSTEM TASK TABLE (STT)
SET SYSTEM DEFINED IN WORD 2 OF STT
FORCE TASK INTO EXECUTION
EXIT

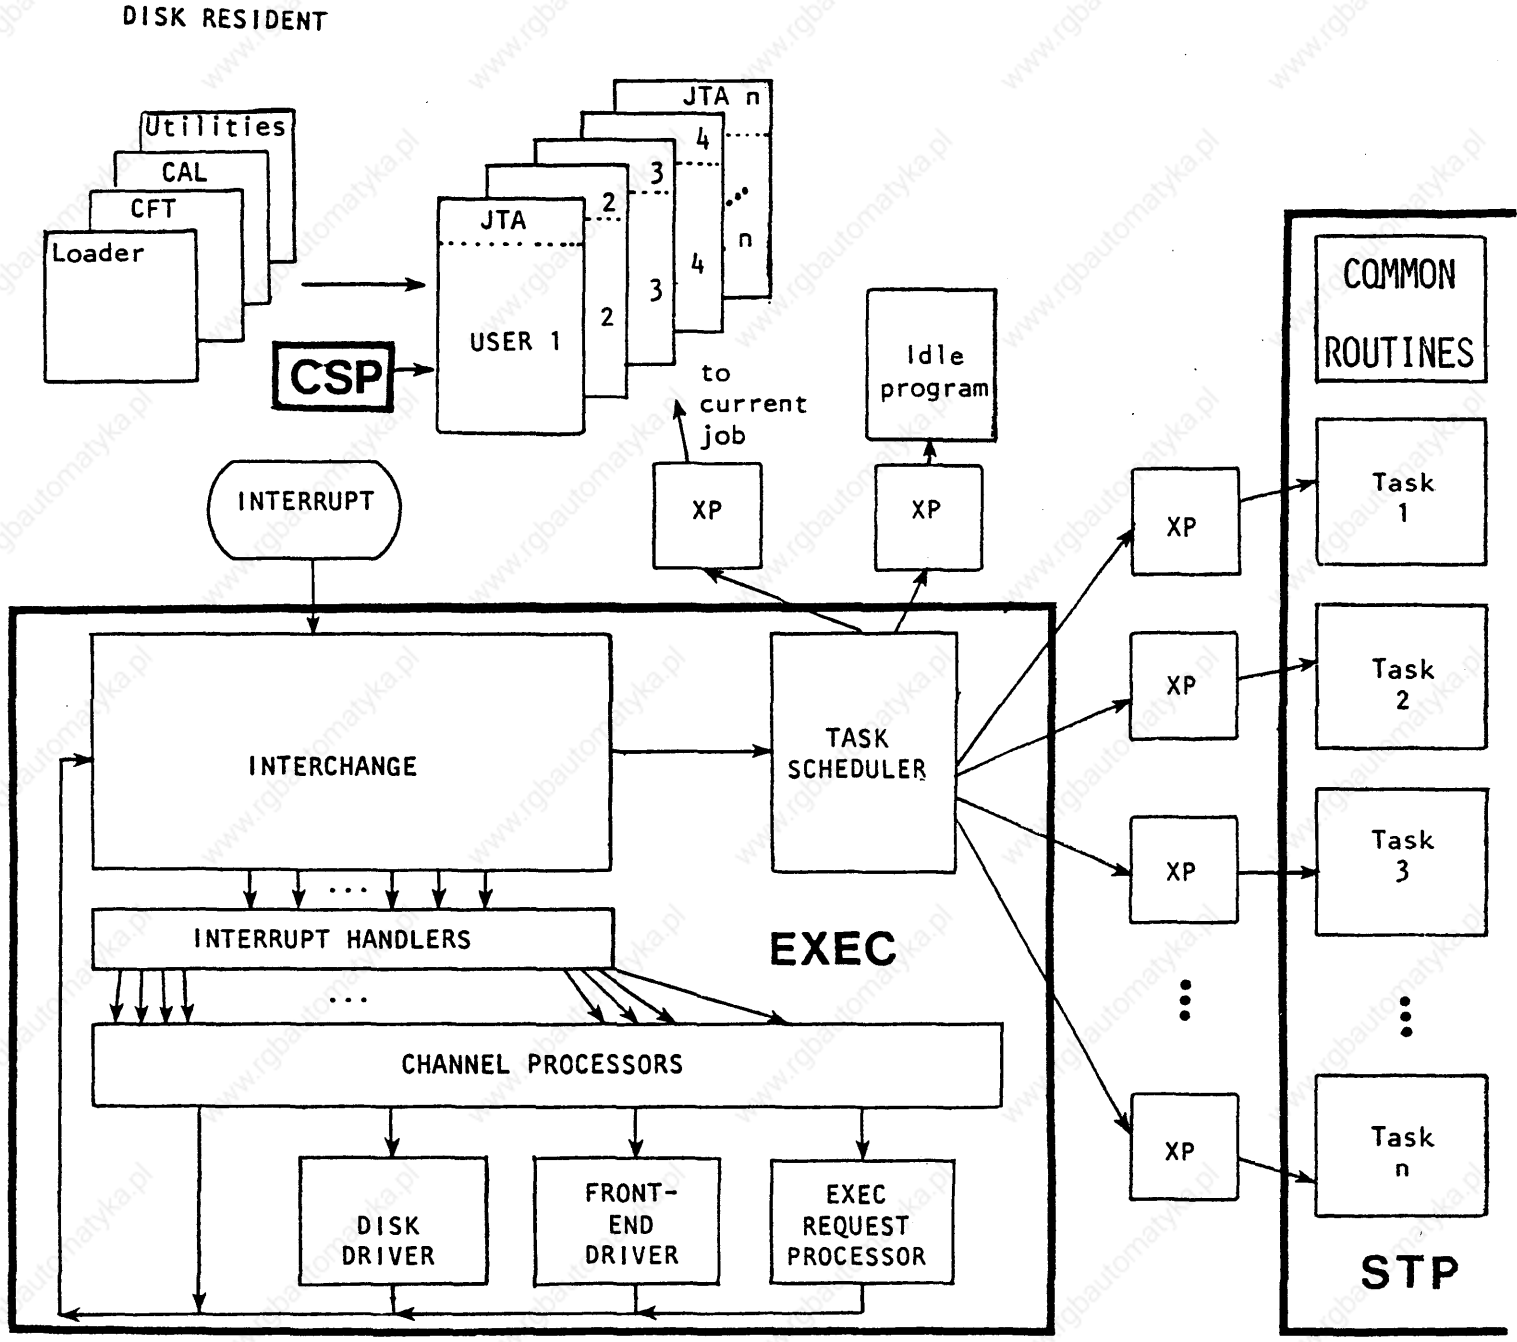
task ID
P-register for new task
01

SYSTEM EXECUTIVE PROGRAM (EXEC)

- CONTROL CENTER FOR COS
- EXECUTES IN MONITOR MODE
- CAN ACCESS ALL OF MEMORY



EXEC HISTORY TRACE

- CIRCULAR BUFFER BEGINS AT LOCATION DBE
- LOCATION DBFP POINTS TO NEXT BUFFER ADDRESS
- EACH TRACE MESSAGE 4 WORDS IN LENGTH
- CIRCULAR BUFFER HOLDS THE 1024 MOST CURRENT MESSAGES.
- FUNCTIONS MAY BE COLLECTIVELY ENABLED/DISABLED THROUGH SETTING OF LOCATION DBUGM AND ITS ASSOCIATED FUNCTION TABLE.
- SETTING LOCATION DBUGM NONZERO ENABLES ALL FUNCTIONS
- SETTING DBUGM+FUNCTION NUMBER ENABLES THE FUNCTION

2.25

DISK DRIVER (RO11)

- DOES THE PHYSICAL I/O ON DISKS
- REQUESTS TO RO11 QUEUED VIA THE REQUEST TABLE (RQT)
- UPDATES THE DATASET PARAMETER TABLE (DSP)
- EXAMINES THE DISK RESERVATION TABLE (DRT) FOR USEABLE DISK SPACE
- PERFORMS SERVO OFFSET AND DATA STROBE FUNCTIONS FOR ERROR RECOVERY

COMMON SUBROUTINES

SYSTEM TASK PROCESSOR

- DEFINITION - CONSISTS OF TABLES, COMMON SUBROUTINES, TASKS, AND I/O ROUTINES.

- COMMON SUBROUTINES
  - RE-ENTRANT ROUTINES
  - USED BY TASKS

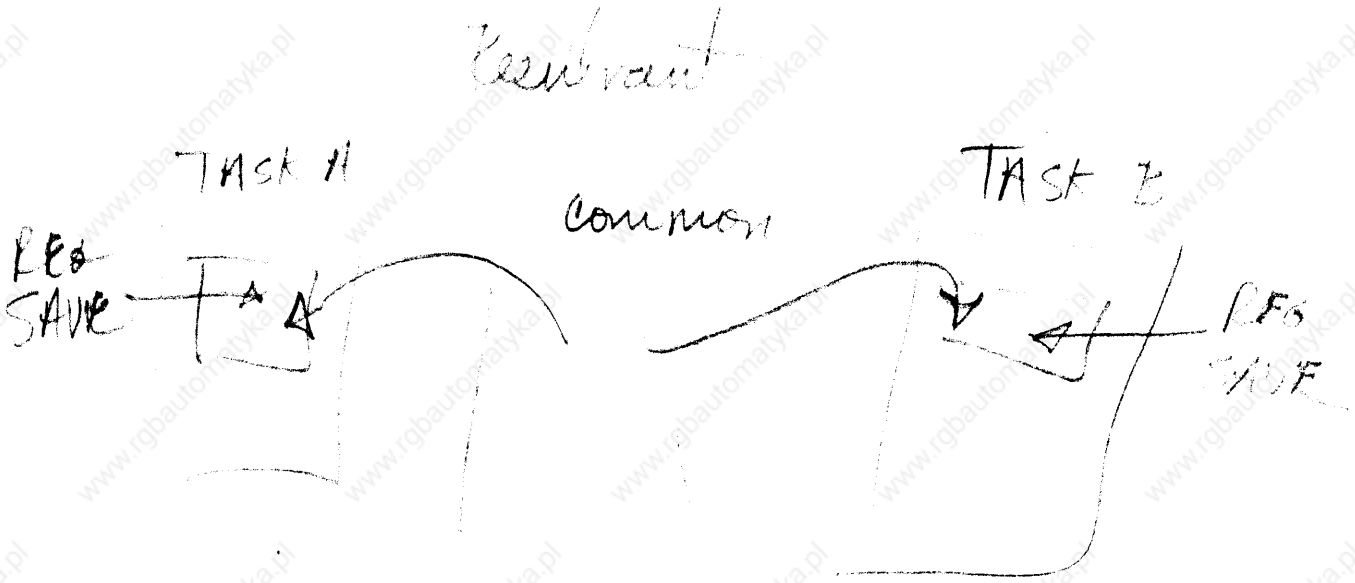
- TASKS
  - PERFORMS A SPECIFIC OPERATION
  - CAN BE CALLED BY OTHER TASKS
  - HAVE THEIR OWN XP's
  - HAVE THEIR OWN ID NUMBERS ($0\text{-}35_8$).
  - HAVE THEIR OWN PRIORITIES ($0\text{-}377_8$).
  - BA AND LA THE SAME FOR ALL TASKS (BA=B@STP, LA=I@MEM)
  - COMMUNICATE WITH EXEC, EACH OTHER AND WITH USER JOBS.

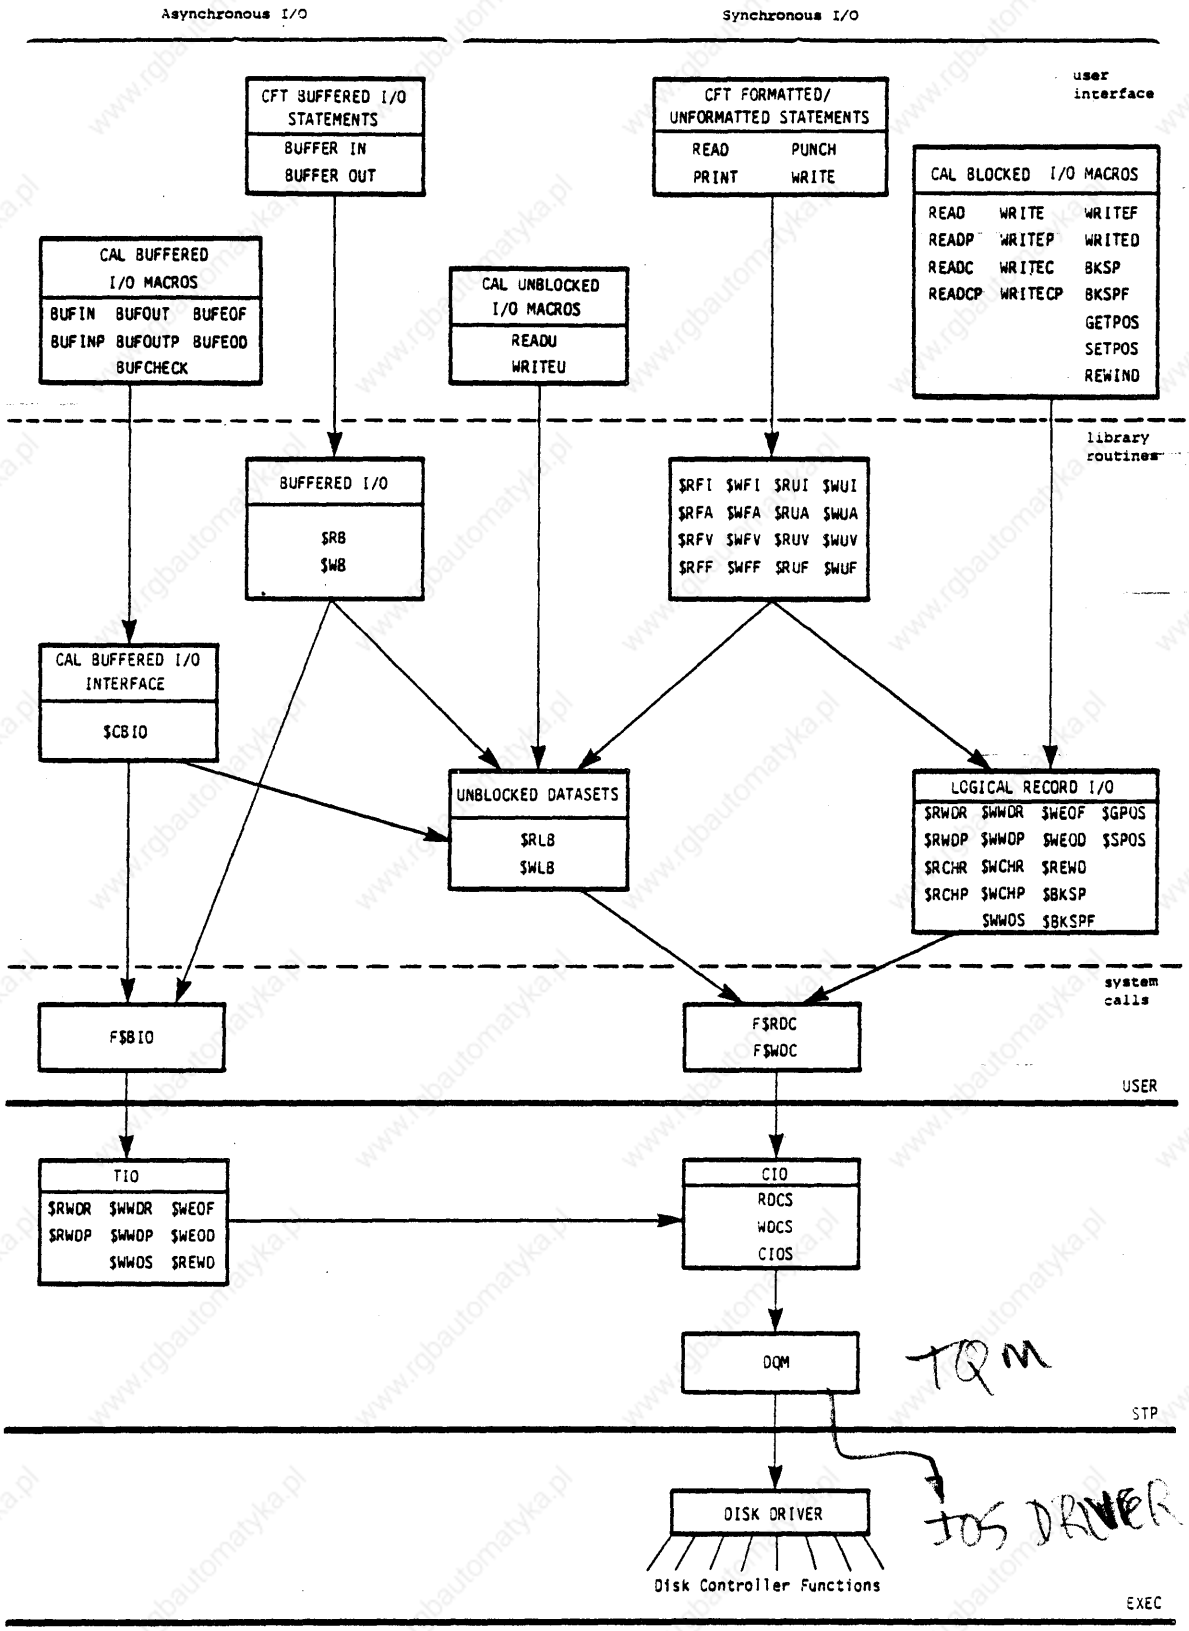
- TABLES
  - USED BY STP AND EXEC

STP COMMON ROUTINES

- USED BY TASKS TO PERFORM:

  TASK LOGICAL INPUT/OUTPUT (TIO)
  CIRCULAR INPUT/OUTPUT (CIO)
  MEMORY MANAGEMENT
  ITEM CHAINING/UNCHAINING
  TASK TO TASK COMMUNICATION





Overview of COS I/O

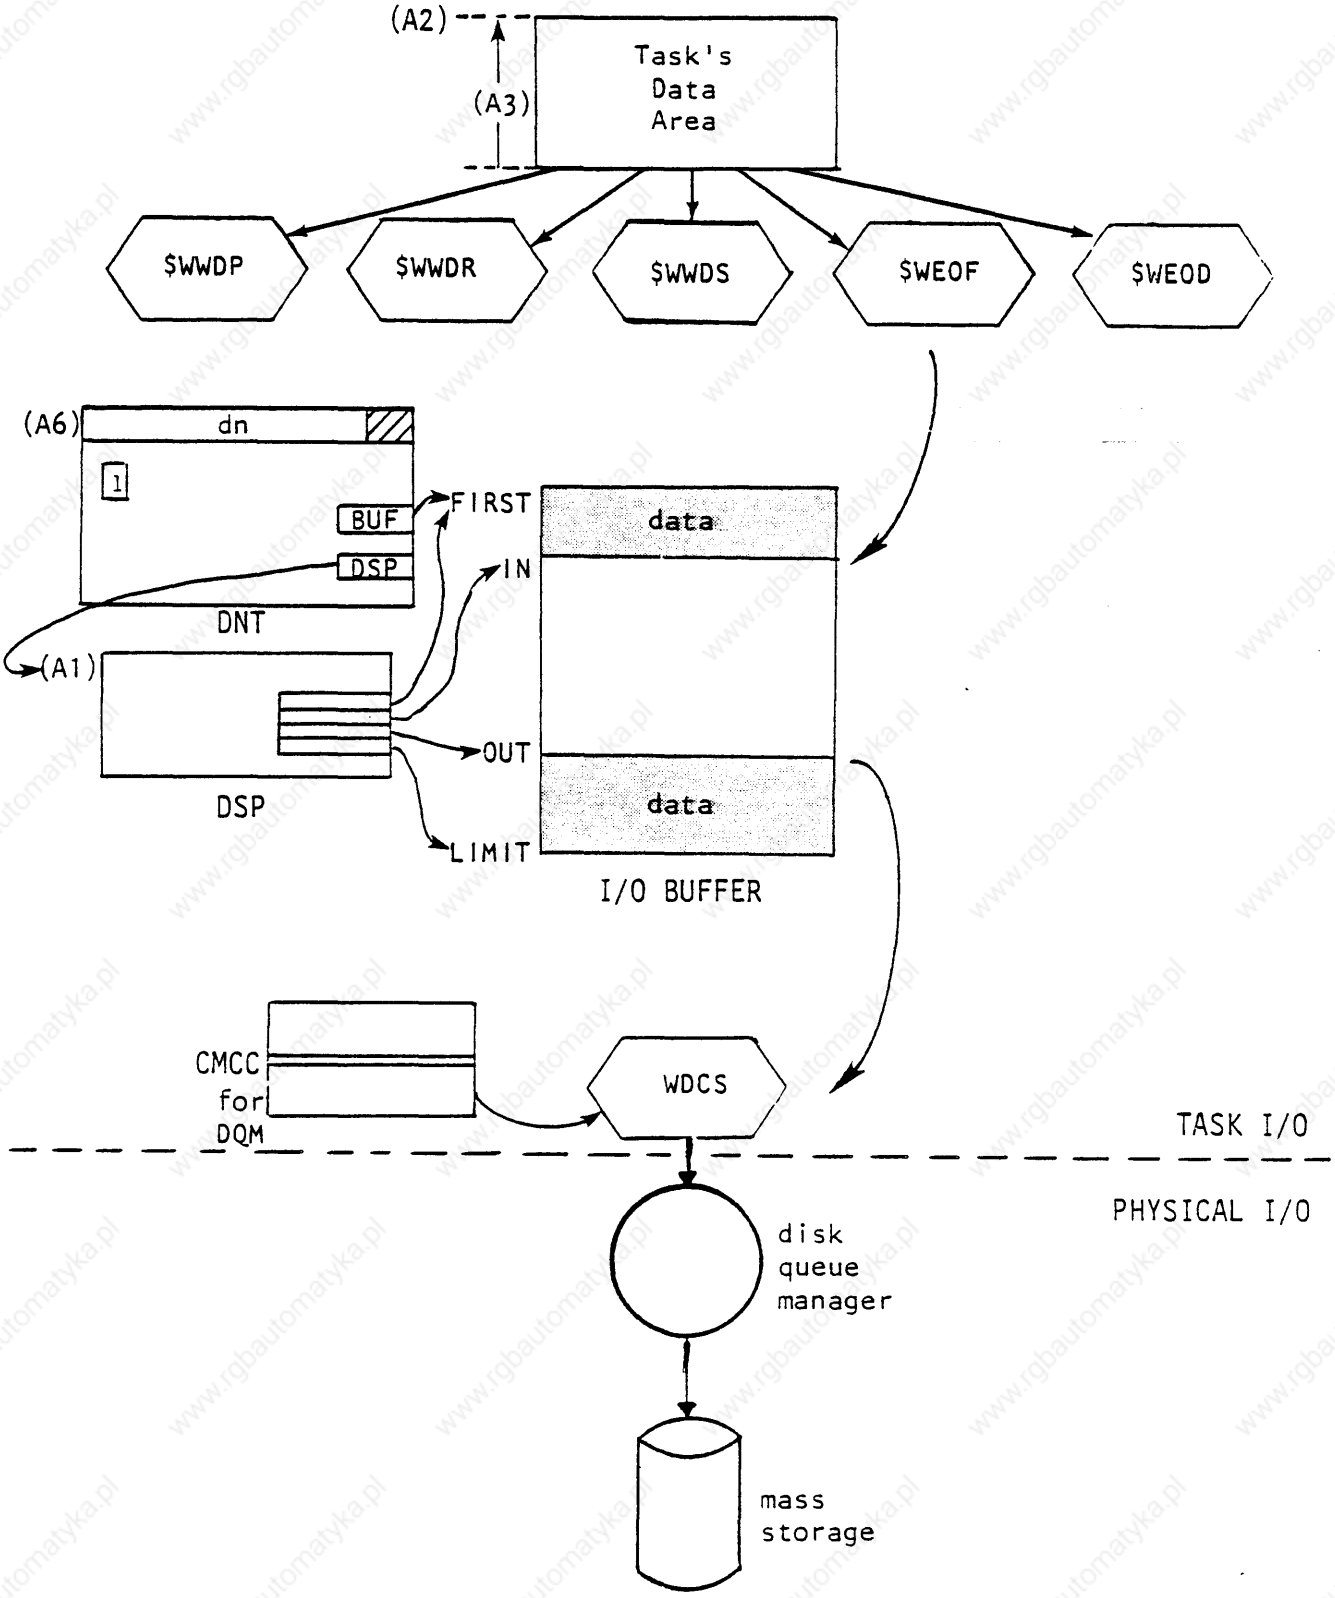
TASK LOGICAL I/O (TIO)

- ALLOWS A SYSTEM PROGRAMMER TO DO LOGICAL I/O AT THE TASK LEVEL.

- TIO ROUTINES ARE:
  - $RWDP/$RWDR-READ WORDS PARTIAL/FULL RECORD
  - $WWDP/$WWDR-WRITE WORDS PARTIAL/FULL RECORD
  - $WEOF-WRITE END OF FILE
  - $WEOD-WRITE END OF DATA
  - $REWD-REWIND A DATASET
  - $WWDS-WRITE WORDS--UNUSED BIT COUNT

- TASKS CALL TIO BY PLACING REQUIRED PARAMETERS IN 'A' REGISTERS AND EXECUTING A RETURN JUMP TO THE ROUTINE.

- 1 TIO ROUTINE ($WWDP/$WWDR) WILL BE EXAMINED HERE. REFER TO SM0040 FOR REMAINDER OF TIO ROUTINES.



TIO logical write

- $WWDP/$WWDR WRITES THE NUMBER OF WORDS SPECIFIED INTO THE I/O BUFFER. $WWD IS CALLED VIA A RETURN JUMP WITH THE CALLER PROVIDING THE FOLLOWING:

ENTRY CONDITIONS:	(A1)	Address of DSP
	(A2)	FWA of task's data area
	(A3)	Word count If count is 0, no data is transferred
	(A6)	Address of DNT
	(A7)	Address of JXT (=0 if not job related)
RETURN CONDITIONS:	(A0)	Status
		<0 TIO error
		=0 Logical I/O complete

CIRCULAR I/O

- PERFORMS PHYSICAL I/O ON A DATASET

  ACCESSIBLE TO TASKS THROUGH TIO AND DIRECT CALLS.

  CIO ROUTINES ARE:

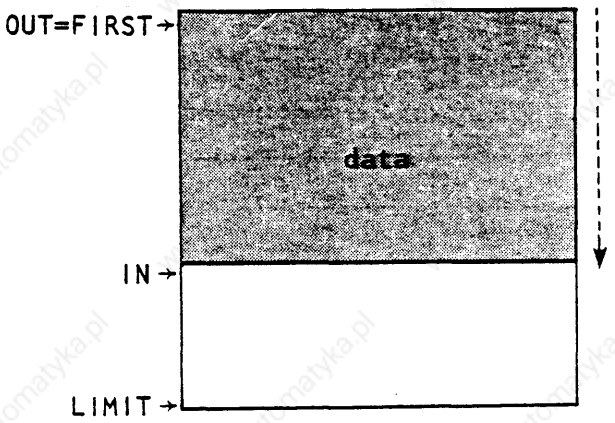
  RDCS-READ CIRCULAR REQUEST

  WDCS-WRITE CIRCULAR REQUEST

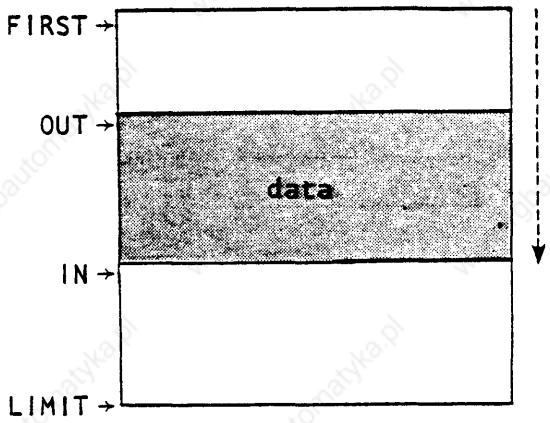
- TASKS CALL CIO BY PLACING REQUIRED PARAMETERS IN 'A' REGISTERS AND EXECUTING A RETURN JUMP TO THE ROUTINE.

- CIO READS/WRITES 512 WORD BLOCKS. THE CALLER HAS THE RESPONSIBILITY OF MAINTAINING THE BUFFER IN/OUT POINTER IN THE DSP. AS SHOWN IN THE PREVIOUS $WWD FLOW DIAGRAM.

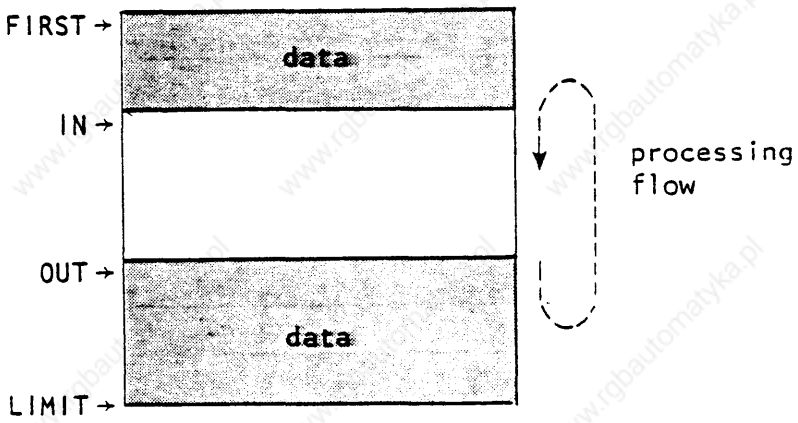
- THE CALLER SENSES COMPLETION OF PHYSICAL I/O BY CALLING GETREPLY. IF A REPLY IS FOUND THE CALLER SHOULD CALL ROUTINE REPCIO WITH S1 AND S2 INTACT FROM GETREPLY.



A. Filling the buffer



B. Emptying the buffer

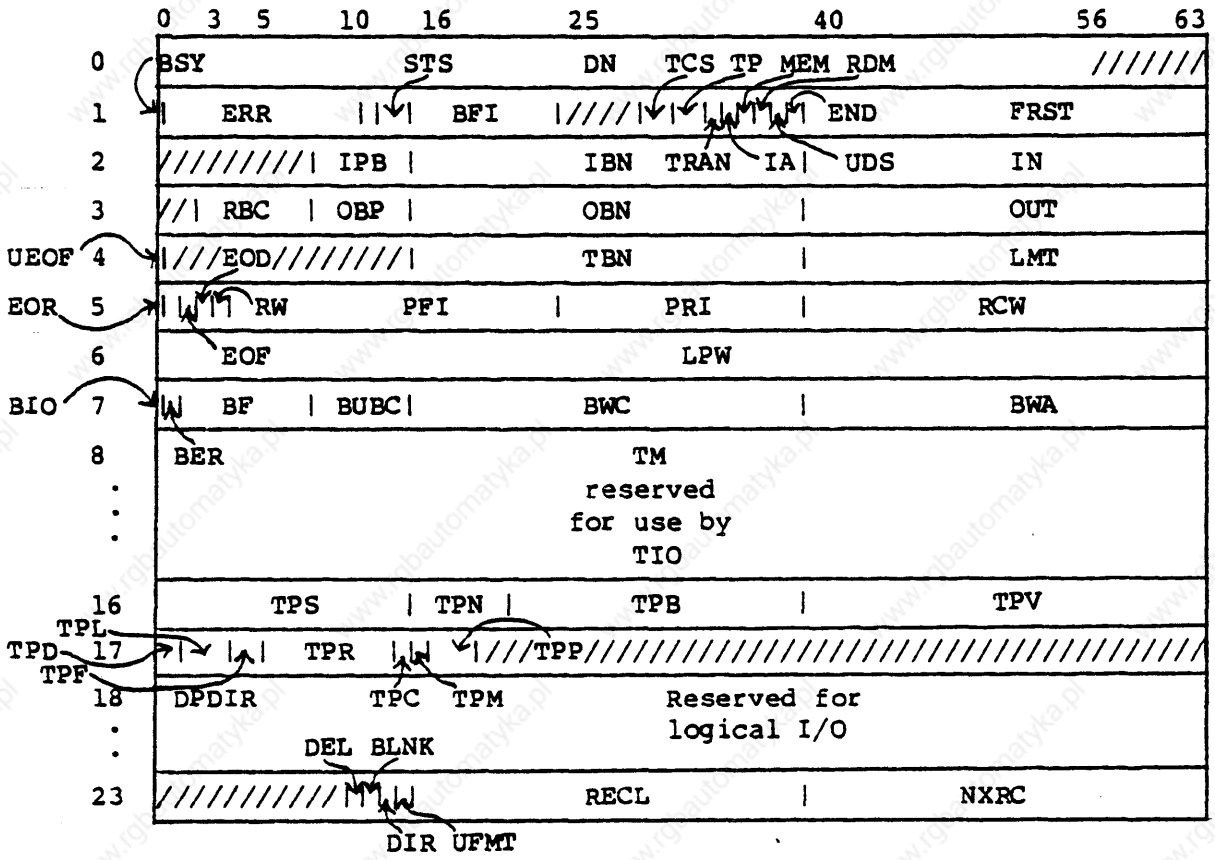


C. Concurrently filling
and emptying the buffer

Physical I/O

DATASET PARAMETER AREA - DSP

Logical I/O requires the presence of a DSP for the dataset in the user's field. Refer to publication SR-0011 for details of DSP use.



Dataset Parameter Area (DSP)

MEMORY MANAGEMENT

- PROVIDES TEMPORARY MEMORY AREAS FOR TASKS (AREAS IN STP)
- MEMORY AREAS ARE OF VARIABLE-SIZE
- MEMORY POOLS ARE USED

MEMORY MANAGEMENT ROUTINES ARE:

MEMAL-ALLOCATES A TASK MEMORY AREA

MEMDE-DEALLOCATES A TASK MEMORY AREA

- MEMAL ALLOCATES A VARIABLE-SIZE MEMORY AREA TO A TASK. MEMAL IS CALLED VIA A RETURN JUMP WITH THE CALLER PROVIDING:

INPUT REGISTERS: (A6) = Number of memory pool from which to allocate

(A7) = Number of words desired

OUTPUT REGISTERS: (A6) = Status:

0 Good status
1 Invalid memory pool number
2 Invalid number of words requested
3 Memory not available

(A7) = Address of first usable word of memory to be allocated

- MEMDE RETURNS (DEALLOCATES) MEMORY TO THE MEMORY POOL FOR REALLOCATION. MEMDE IS CALLED VIA A RETURN JUMP WITH THE CALLER PROVIDING:

INPUT REGISTERS:
(A6) = Memory pool number
(A7) = Address of first usable word of memory to be deallocated

OUTPUT REGISTERS:
(A6) = Status:
0 Good return
1 Invalid address
2 Area not currently allocated
3 Invalid pool number

(A7) = Address of memory released; meaningful only if status is 0.

```

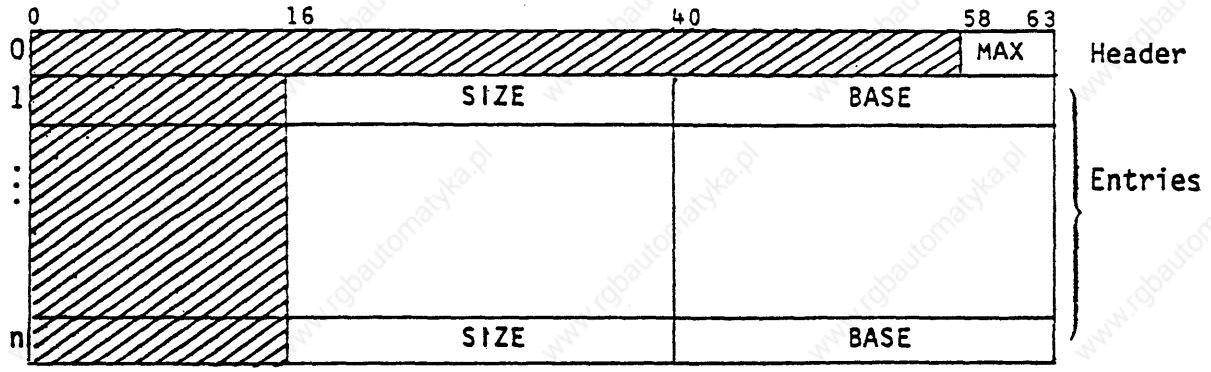
POOL TABLE - POOLTBL

The Pool Table is an STP-resident table used for memory pool management.



Pool Table

HEADER

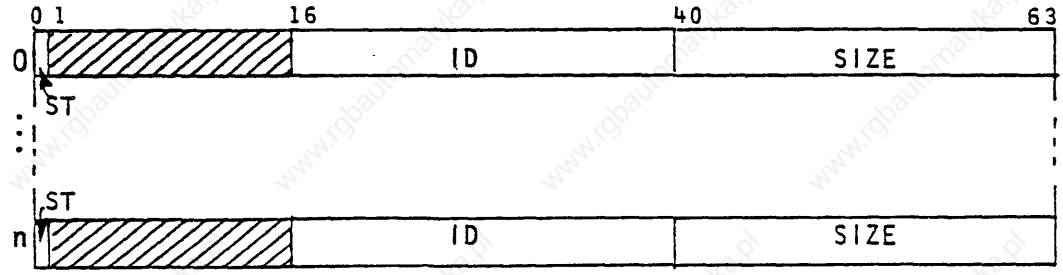
Field	Word	Bits	Description
PTMAX	0	58-63	Maximum valid memory pool number in system

ENTRY

Field	Word	Bits	Description
PTSIZE	0	16-39	Size of the memory pool
PTBASE	0	40-63	Base address of the memory pool

MEMORY POOL - POOLI....n

Memory pool areas are surrounded by header and trailer words that control the allocation and deallocation of the areas.



Memory Pool

Field	Word	Bits	Description
MPST	0,n,etc.	0	Status of the memory area: 0 Available 1 In use
MPID	0,n,etc.	16-39	Memory pool identification: 01010101 Pool 1 0x0x0x0x Pool x
MPSIZE	0,n,etc.	40-63	Size of the memory pool

ITEM CHAINING/UNCHAINING

- PROVIDES MEANS FOR TASKS TO LINK DATA
- AMOUNT OF DATA TO LINK IS DEFINED BY THE TASKS
- MAY BE USED TO LINK REGISTER DATA OR POOL DATA
- DATA IS CONSIDERED AN ITEM

- CHAIN/CHAINF PLACE AN ITEM ON A CHAIN. CHAIN WILL PLACE AN ITEM ON THE END WHEREAS CHAINF WILL PLACE AN ITEM ON THE FRONT OF A CHAIN. CHAIN/CHAINF ARE CALLED VIA A RETURN JUMP WITH THE CALLER PROVIDING THE FOLLOWING:

INPUT REGISTERS:	(A6) = Address of chain control word
	(A7) = Address of the item to be chained
OUTPUT REGISTERS:	(A6) = Unchanged from input
	(A7) = Unchanged from input

CHAIN CONTROL - CC

Intertask communication requires chain control words in the format defined.

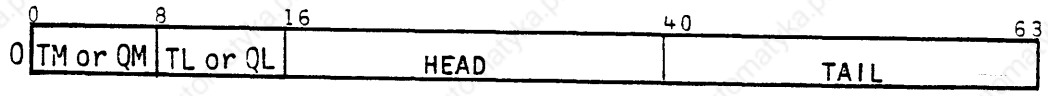

Figure 1.CC-1. Chain Control Word

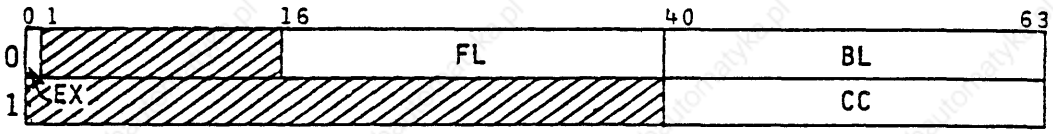
Field	Word	Bits	Description
CCTM	0	0-7	Maximum number of items to be queued to a particular task
CCQM	0	0-7	Maximum number of items to be queued from one task to another
CCTL	0	8-15	Number of items queued to a particular task
CCQL	0	8-15	Number of items to be queued from one task to another
CCHEAD	0	16-39	Address of first item on the chain
CCTAIL	0	40-63	Address of last item on the chain

CHAIN ITEM - CI

Any item queued using the STP common routines CHAIN and UNCHAIN must reserve the first two words of the item to be used by the common routines.



Chain Item

Field	Word	Bits	Description
CIEX	0	0	This bit, if set, indicates that the item is in execution.
CIFL	0	16-39	Forward link; address of next item on the chain
CIBL	0	40-63	Backward link; address of the preceding item on the chain
CICC	1	40-63	Address of the chain control word for this item

TASK TO TASK COMMUNICATION

- THERE ARE 2 AREAS FOR INTERTASK COMMUNICATION

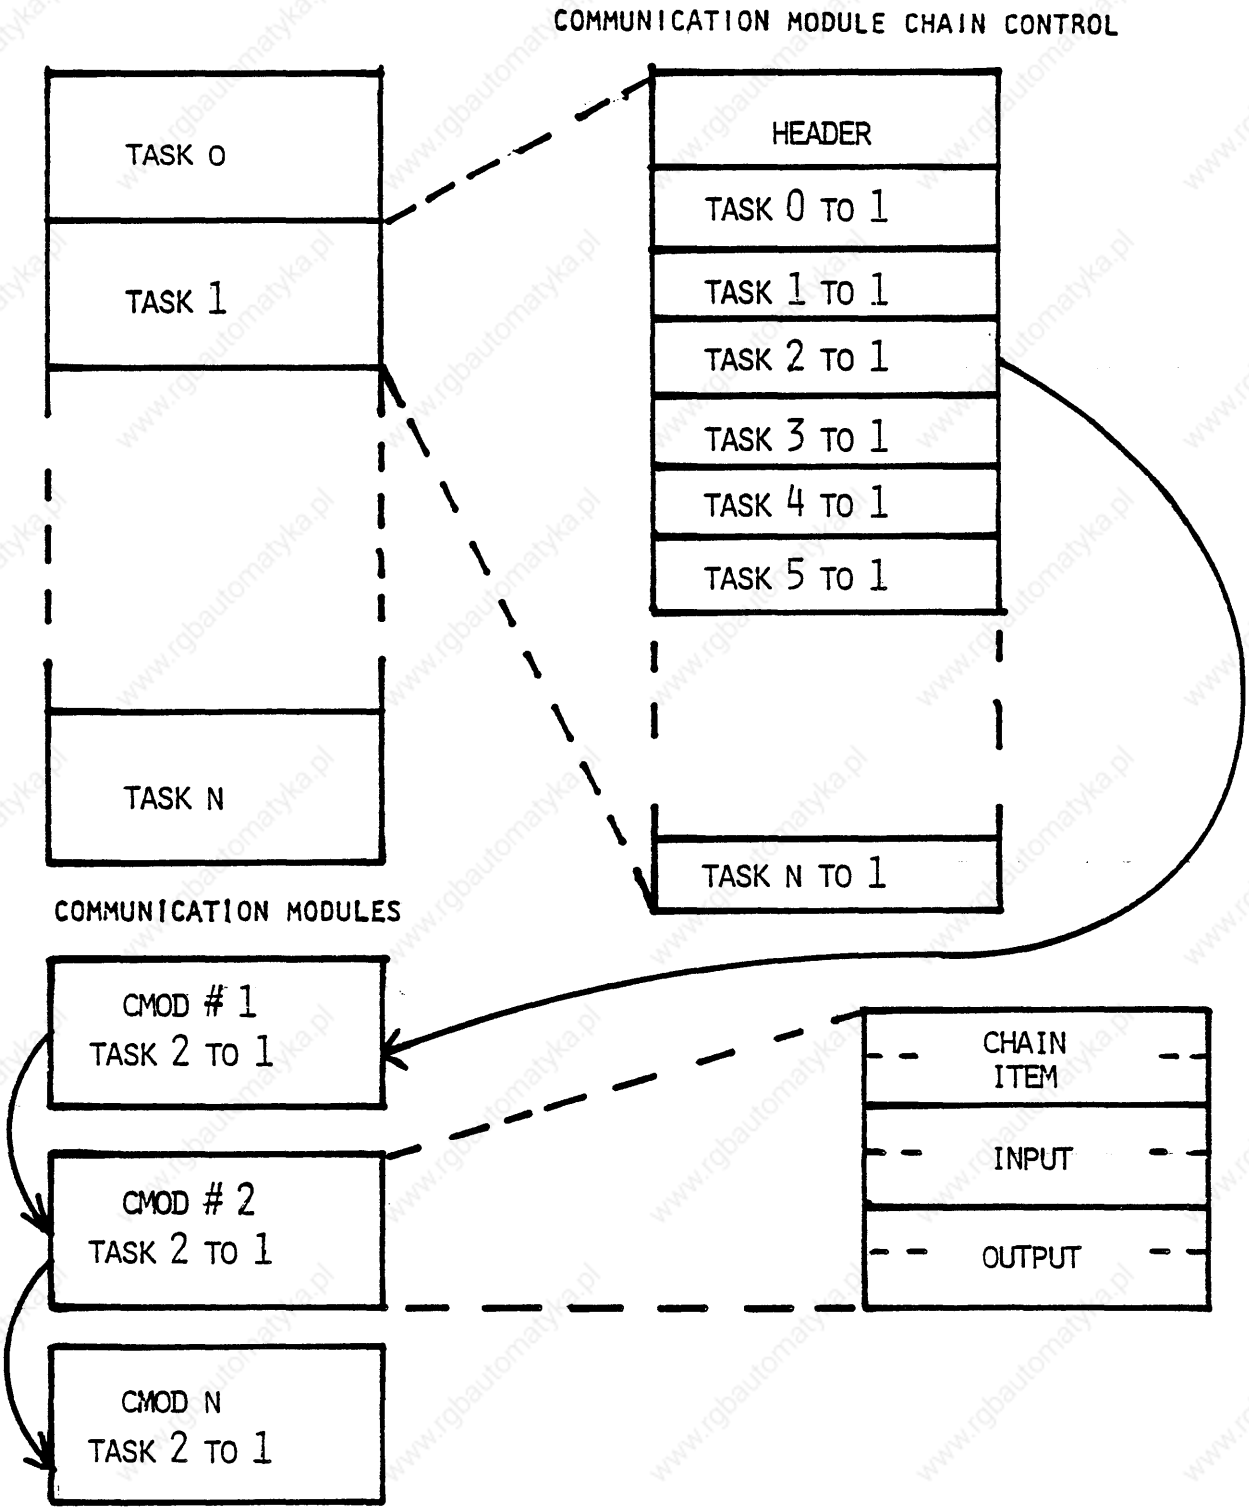
1. COMMUNICATION MODULE CHAIN CONTROL (CMCC).

   CONTIGUOUS AREA
   ENTRY FOR EACH POSSIBLE TASK COMBINATION
   ARRANGED IN TASK NUMBER SEQUENCE
   POINT TO THE COMMUNICATION MODULES (CMOD's)

2. COMMUNICATION MODULE (CMOD)

   ALLOCATED AS NEEDED FROM A POOL
   ALL TASK REQUESTS ARE THROUGH A CMOD.
   ALL TASK REPLIES ARE THROUGH A CMOD.
   - 2 WORDS FOR SYSTEM CONTROL
   - 2 WORDS AS TASK INPUT REGISTERS
   - 2 WORDS AS TASK OUTPUT REGISTERS

- TASKS PLACE REQUESTS IN THE INPUT WORDS OF A CMOD.
- TASKS RECEIVE REPLIES IN THE OUTPUT WORDS OF THEIR CMOD
- FORMAT OF A REQUEST IS DEFINED BY THE CALLED TASK



COMMUNICATION MODULE CHAIN CONTROL
TASK 0
TASK 1
TASK N
HEADER
TASK 0 TO 1
TASK 1 TO 1
TASK 2 TO 1
TASK 3 TO 1
TASK 4 TO 1
TASK 5 TO 1
TASK N TO 1
COMMUNICATION MODULES

TASK 2 TO 1
CHAIN ITEM
INPUT
OUTPUT

- A TASKS CALLS EXEC TO ACTIVATE ANOTHER TASK.

- THE TASK SCHEDULER IN EXEC EXAMINES THE SYSTEM TASK TABLE TO DETERMINE THE HIGHEST PRIORITY TASK READY TO EXECUTE.

- THE RE-ENTRANT ROUTINES;
  PUTREQ
  GETREQ
  PUTREPLY
  GETREPLY
  TSKREQ

  ARE USED FOR INTERTASK COMMUNICATION.

- THE REQUEST FOR INTERTASK COMMUNICATION IS PASSED IN REGISTERS S1 AND S2.

- PUTREQ PLACES THE REQUEST IN THE INPUT REGISTERS OF A CMOD AND LINKS THE CMOD TO THE APPROPRIATE CMCC. PUTREQ IS CALLED VIA A RETURN JUMP WITH THE CALLER PROVIDING THE FOLLOWING:

INPUT REGISTERS:

(A1) = "Throw-away" indicator. If (A1) is positive, control is not returned to caller until request is queued. If (A1) is negative, control returns with no action taken if the request cannot be queued without suspending the caller.

(A2) = Requested task's ID

(S1) = INPUT+0
(S2) = INPUT+1
} request

OUTPUT REGISTERS: None

```

- TSKREQ QUEUES A REQUEST TO ANOTHER TASK.
- TSKREQ IS CALLED VIA A RETURN JUMP WITH THE CALLER PROVIDING THE FOLLOWING:

INPUT REGISTERS:	(A2) = ID OF REQUESTED TASK	
	(S1) = INPUT+0	} REQUEST
	(S2) = INPUT+1	
OUTPUT REGISTERS:	(S1) = OUTPUT+0	} REPLY
	(S2) = OUTPUT+1	

- ONCE THE REQUEST HAS BEEN PROCESSED, THE CALLER MAY EXAMINE ITS S1,S2 REGISTERS FOR A REPLY. CONVENTIONALLY, S1=ZERO WHEN THERE IS NO ERROR, OTHERWISE S1=ERR CODE. S2=THE CALLING TASKS INPUT+0 REGISTER (S1) INFORMATION.

```

USER TO STP CALLS

- ADVANCE JOB
- ABORT JOB
- GET CURRENT DATE
- GET CURRENT TIME
- ENTER LOGFILE MESSAGE
- DATASET RECALL
- TERMINATE JOB
- SET SENSE SWITCH
- OPEN DATASET
- REQUEST MEMORY
- CLOSE DATASET
- CREATE DNT
- SET EXCHANGE PACKAGE MODE
- GET NEXT CONTROL STATEMENT
- LOAD BINARY DATASET
- RETURN DATASET
- PERMANENT DATASET MANAGEMENT REQUEST
- READ DISC CIRCULAR
- WRITE DISC CIRCULAR
- GET SYSTEM REVISION NUMBERS
- DISPOSE DATASET
- GET CURRENT JULIAN DATE
- RETURN ACCUMULATED CPU TIME
- RETURN ACCOUNTING INFORMATION
- SET P REGISTER & SUSPEND USER
- CLEAR SENSE SWITCH
- TEST SENSE SWITCH
- DELAY JOB

- A USER COMMUNICATES WITH STP THROUGH MACRO CALLS.

STARTUP (Z)

www.rgbautomatyka.pl

TASK PROCESSORS

- CURRENT TASKS ARE:

  CRAY-OS STARTUP

  STATION CALL PROCESSOR

  DISK QUEUE MANAGER

  PERMANENT DATASET MANAGER

  JOB CLASS MANAGER

  JOB SCHEDULER

  EXCHANGE PACKAGE PROCESSOR

  MESSAGE PROCESSOR

  MEMORY ERROR PROCESSOR

  DISK ERROR CORRECTION

  SYSTEM PERFORMANCE MONITOR

  OVERLAY MANAGER

  TAPE QUEUE MANAGER

CRAY-OS STARTUP

- LOADS CRAY-OS OPERATING SYSTEM (COS) INTO MEMORY.
- BEGINS EXECUTION OF THE OPERATING SYSTEM.
- GENERATES OR RECOVERS SYSTEM TABLES.
- THREE METHODS OF STARTUP.

INSTALL-INITIATION OF COS THE FIRST TIME

DEADSTART-CONTINUATION OF COS FOLLOWING A NORMAL SYSTEM SHUTDOWN

RESTART-CONTINUATION OF COS FOLLOWING A SYSTEM INTERRUPTION.

INSTALL

- LOADS THE CRAY-1 OPERATING SYSTEM (COS) INTO CRAY-1 MEMORY.
- CRAY-1 MASS STORAGE IS INITIALIZED FOR THE VERY FIRST TIME.

  A DEVICE LABEL (DVL) IS WRITTEN ON EACH DISK UNIT.

  SPACE IS ZEROED AND RESERVED ON THE MASTER DEVICE SUFFICIENT TO HOLD CRAY-1 MEMORY SIZE.

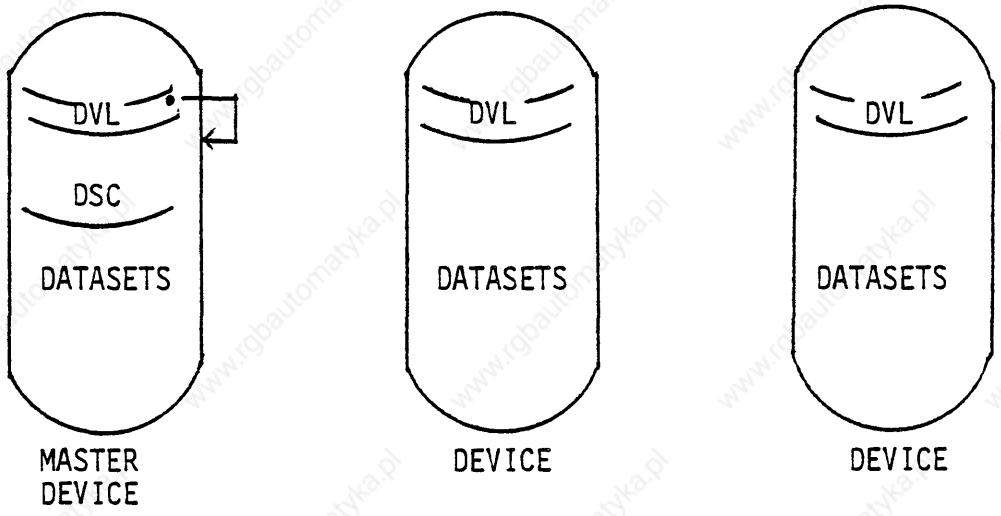
  A ROLL JOB INDEX DATASET IS INITIALIZED ($ROLL).

- SYSTEM TABLES ARE INITIALIZED FOR THE VERY FIRST TIME.

  REFLECT HOW MUCH USEABLE DISK SPACE IS AVAILABLE (DRT).

  CREATES A DISK DATASET CATALOG (DSC) AND WRITES THE DSC TO THE MASTER DEVICE.

  MAKES ENTRIES IN THE DSC FOR $ROLL



Mass Storage Organization

SYSTEM DIRECTORY INITIALIZATION

- THE SYSTEM DIRECTORY (SDR) MUST BE INITIALIZED AFTER ANY INSTALL (AUTOMATIC IN DEADSTART AND RESTART).

- INITIALIZATION OCCURS THROUGH SUBMISSION OF A HIGH PRIORITY JOB.

- THE JOB's PRIORITY SHOULD ENABLE IT TO EXECUTE BEFORE ANY OTHER JOB IN THE INPUT QUEUE.

- ONCE A DATASET NAME IS ENTERED IN THE SDR IT IS ACCESSABLE TO OTHER JOBS.

- AN 'ACCESS' CONTROL STATEMENT WITH PARAMETER 'ENTER' IS SPECIFIED FOR EACH DATASET BEING ENTERED IN THE SDR.

SAMPLE JOB:

```
JOB,JN=SYSDIR,T=2,M=20,P=15.
*.
*.  SDR initialization job
*.
ACCESS,ENTER,DN=AUDIT.
ACCESS,ENTER,DN=BUILD.
ACCESS,ENTER,DN=CAL.
ACCESS,ENTER,DN=CFT.
ACCESS,ENTER,DN=COMPARE.
ACCESS,ENTER,DN=COPYD.
ACCESS,ENTER,DN=COPYF.
ACCESS,ENTER,DN=COPYR.
ACCESS,ENTER,DN=DSDUMP.
ACCESS,ENTER,DN=DUMP.
ACCESS,ENTER,DN=EXTRACT.
ACCESS,ENTER,DN=FDUMP.
ACCESS,ENTER,DN=LDR.
ACCESS,ENTER,DN=PDSDUMP.
ACCESS,ENTER,DN=PDSLOAD.
ACCESS,ENTER,DN=SKIPD.
ACCESS,ENTER,DN=SKIPF.
ACCESS,ENTER,DN=SKIPR.
ACCESS,ENTER,DN=UNB.
ACCESS,ENTER,DN=UPDATE.
ACCESS,ENTER,DN=WRITEDS.
(EOF)
```

DEADSTART

- CONTINUES THE CRAY-1 OPERATING SYSTEM (COS) FOLLOWING A NORMAL SYSTEM SHUTDOWN.

- DELETES DSC ENTRIES FOR INPUT AND OUTPUT DATASETS. (SDT)

- PRESERVES DSC ENTRIES FOR PERMANENT DATASETS.

- PRESERVES DISK SPACE OCCUPIED BY THE SYSTEM DUMP.

- COPIES SYSTEM DUMP TO ANOTHER AREA IF USED AND MAKES IT A PERMANENT DATASET.

- REBUILDS THE SYSTEM DIRECTORY FROM DISK IF DESIRED.

RESTART

- CONTINUES THE CRAY-1 OPERATING SYSTEM (COS) FOLLOWING AN ABNORMAL SYSTEM INTERRUPTION.
- PRESERVES DSC ENTRIES FOR INPUT AND OUTPUT DATASETS.
- PRESERVES DSC ENTRIES FOR PERMANENT DATASETS.
- PRESERVES DISK SPACE OCCUPIED BY THE SYSTEM DUMP.
- COPIES SYSTEM DUMP TO ANOTHER AREA IF USED AND MAKES IT A PERMANENT DATASET.
- PRESERVES ROLLED JOBS AND ASSOCIATED DATASETS IF REQUIRED.
- REBUILDS THE SYSTEM DIRECTORY FROM DISK IF DESIRED.

RECOVERY OF THE SYSTEM DIRECTORY DURING A RESTART

- AN ACCESS OF THE $SDR PERMANENT DATASET IS REQUESTED.
- IF $SDR DOES NOT EXIST THEN THE SYSTEM CREATES $SDR AS A PERMANENT DATASET.
- IF $SDR EXISTS A DATSET NAME TABLE (DNT) IS CREATED AND THE DATASET IS ACCESSED.
- IF THE *SDR COMMAND IS IN THE RESTART PARAMETER FILE THE PREVIOUS $SDR DATASET IS NOT RECOVERED AND A NEW EDITION OF $SDR IS CREATED AS A PERMANENT DATASET.
- ONCE INITIALIZATION OF THE $SDR DATASET IS COMPLETE, ADDITIONAL ENTRIES MAY BE ADDED TO THE SYSTEM DIRECTORY AND THE $SDR DATASET.

RECOVERY OF ROLLED JOBS DURING A RESTART

- A VALIDATION OF THE ROLLED JOB INDEX TABLE ENTRY FOR A JOB ENSURES THE JOB IS NOT MARKED IRRECOVERABLE AND THE JOB RESIDES ON AN AVAILABLE DEVICE.

- THE JOBS JOB TABLE AREA (JTA) IS READ INTO MEMORY AND THE JOBS DATS ARE VERIFIED AS ARE ALL DATS WITHIN THE SYSTEM.

- IF A JOB'S DAT IS INVALID AND THE JOB IS RERUNNABLE THE SYSTEM CLEARS THE INDEX ENTRY AND THE JOB REMAINS ON THE INPUT QUEUE IN THE SYSTEM DATASET TABLE (SDT).

- IF ALL DATS FOR A JOB ARE VALID THE SYSTEM SETS THE DEVICE RESERVATION TABLE (DRT) ENTRIES FOR THE DATS.

DATASET ALLOCATION TABLE (DAT) VERIFICATION

- A DATASET ALLOCATION TABLE (DAT) MUST RESIDE ENTIRELY IN THE SYSTEM FOR SYSTEM DATASETS, AND WITHIN A JOBS JOB TABLE AREA (JTA) FOR A JOB.

- THE DAT MUST POINT TO THE CORRECT JOB EXECUTION TABLE (JXT) ENTRY FOR A JOB (LOCAL) DATASET.

- THE DEVICES USED BY THE DATASETS MUST BE AVAILABLE.

- FOR A DAT THE LOGICAL TRACK ADDRESSES MUST NOT HAVE THE CORRESPONDING BIT SET IN THE DEVICE RESERVATION TABLE (DRT).

- WHEN THE LAST LOGICAL TRACK ADDRESS IS VERIFIED AGAINST THE DRT BIT THE REMAINING ADDRESS COUNT MUST BE ZERO.

- DAT VERIFICATION OCCURS IN TWO PASSES

  FIRST PASS SCANS FOR ERRORS AS ABOVE
  SECOND PASS SETS THE DRT BITS

- PERMANENT DATASETS ARE FURTHER VERIFIED AGAINST THE DISK RESIDENT DATASET CATALOG (DSC) AND EACH DATASET DAT IS COMPARED AGAINST THE DISK COPY.

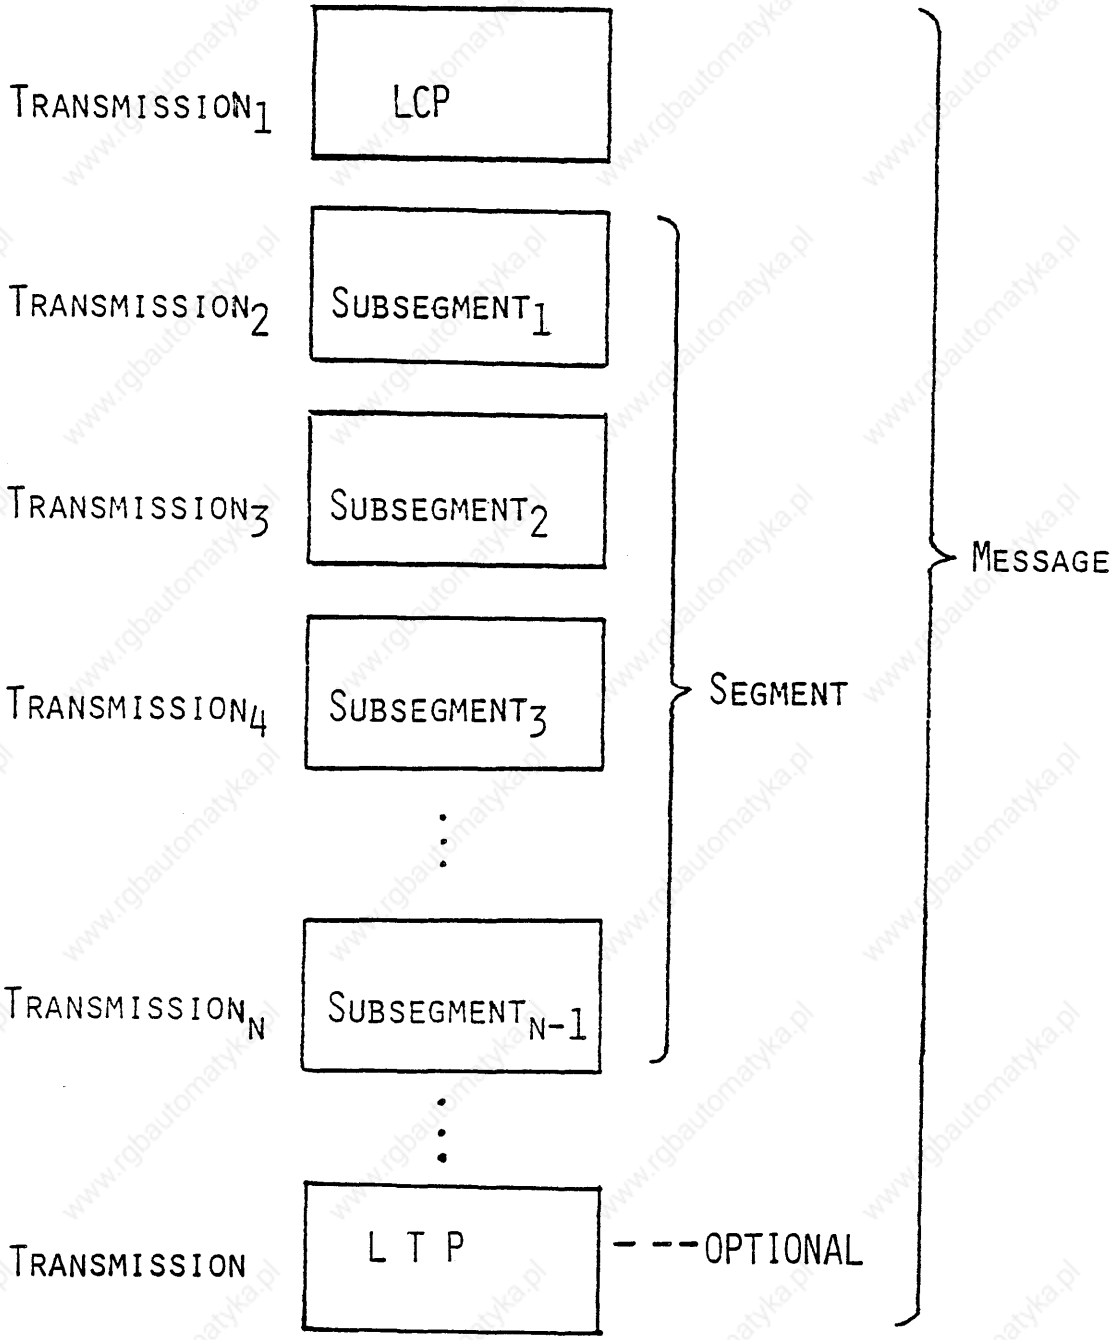
STATION CALL PROCESSOR (SCP)

STATION CALL PROCESSOR (SCP)

- PROVIDES COMMUNICATIONS WITH FRONT-END SYSTEMS.
- MANAGES I/O TRANSMISSION POOLS CREATED AT STARTUP.
- PROVIDES FOR OPERATOR GUIDANCE.
- CHANNEL DISCIPLINE IS TWO WAY ALTERNATE.
- INDEPENDENT OF FRONT-END TYPE.
- MULTIPLEXES STREAMS (8 INPUT AND 8 OUTPUT).

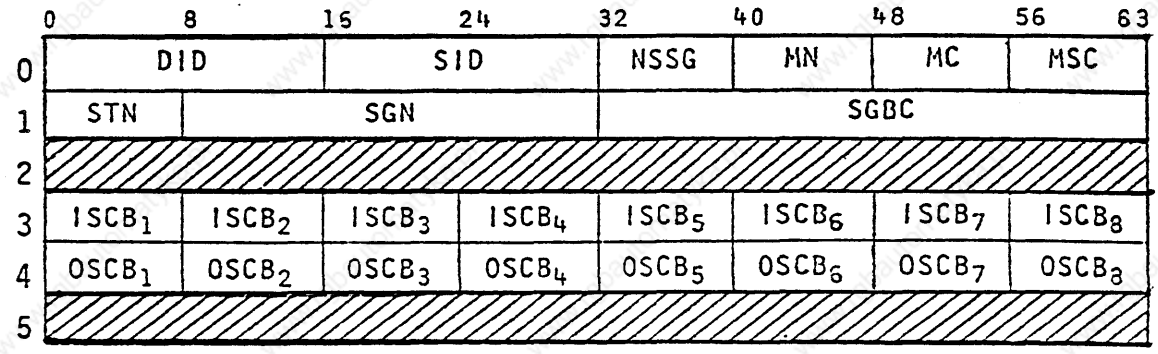
GENERAL INTERFACE PROTOCOL

- EACH MESSAGE IS HEADED BY A LINK CONTROL PACKAGE
- SUBSEGMENT SIZE VARIES WITH FRONT-END



LINK CONTROL PACKAGE

- EACH LCP CONSISTS OF SIX 64-BIT WORDS
- LCP CONTAINS:
  - SOURCE MAINFRAME ID (SID)
  - DESTINATION MAINFRAME ID (DID)
  - NO. OF SUBSEGMENTS (NSSG)
  - MESSAGE NUMBER (MN)
  - MESSAGE CODE (MC)
  - MESSAGE SUB CODE (MSC)
  - STREAM NO. (STN)
  - SEGMENT NUMBER (SGN)
  - SEGMENT LENGTH (SGBC)
  - STREAM CONTROL BYTES (ISCB, OSCB)



Message codes

Code	Function	Sender Front-end	Sender CRAY-1	Segment	Stream Required

†† Optional; front end not required to send

STREAM CONTROL BYTES

- 8 INPUT AND 8 OUTPUT STREAMS

- ALTHOUGH EACH MESSAGE IS ASSIGNED TO ONLY ONE STREAM, THE LCP MUST CARRY STREAM CONTROL BYTES FOR ALL 16 STREAMS.

Octal Code	Mnemonic	Request/Response	Sender	Receiver
00	IDL	Idle	x	x

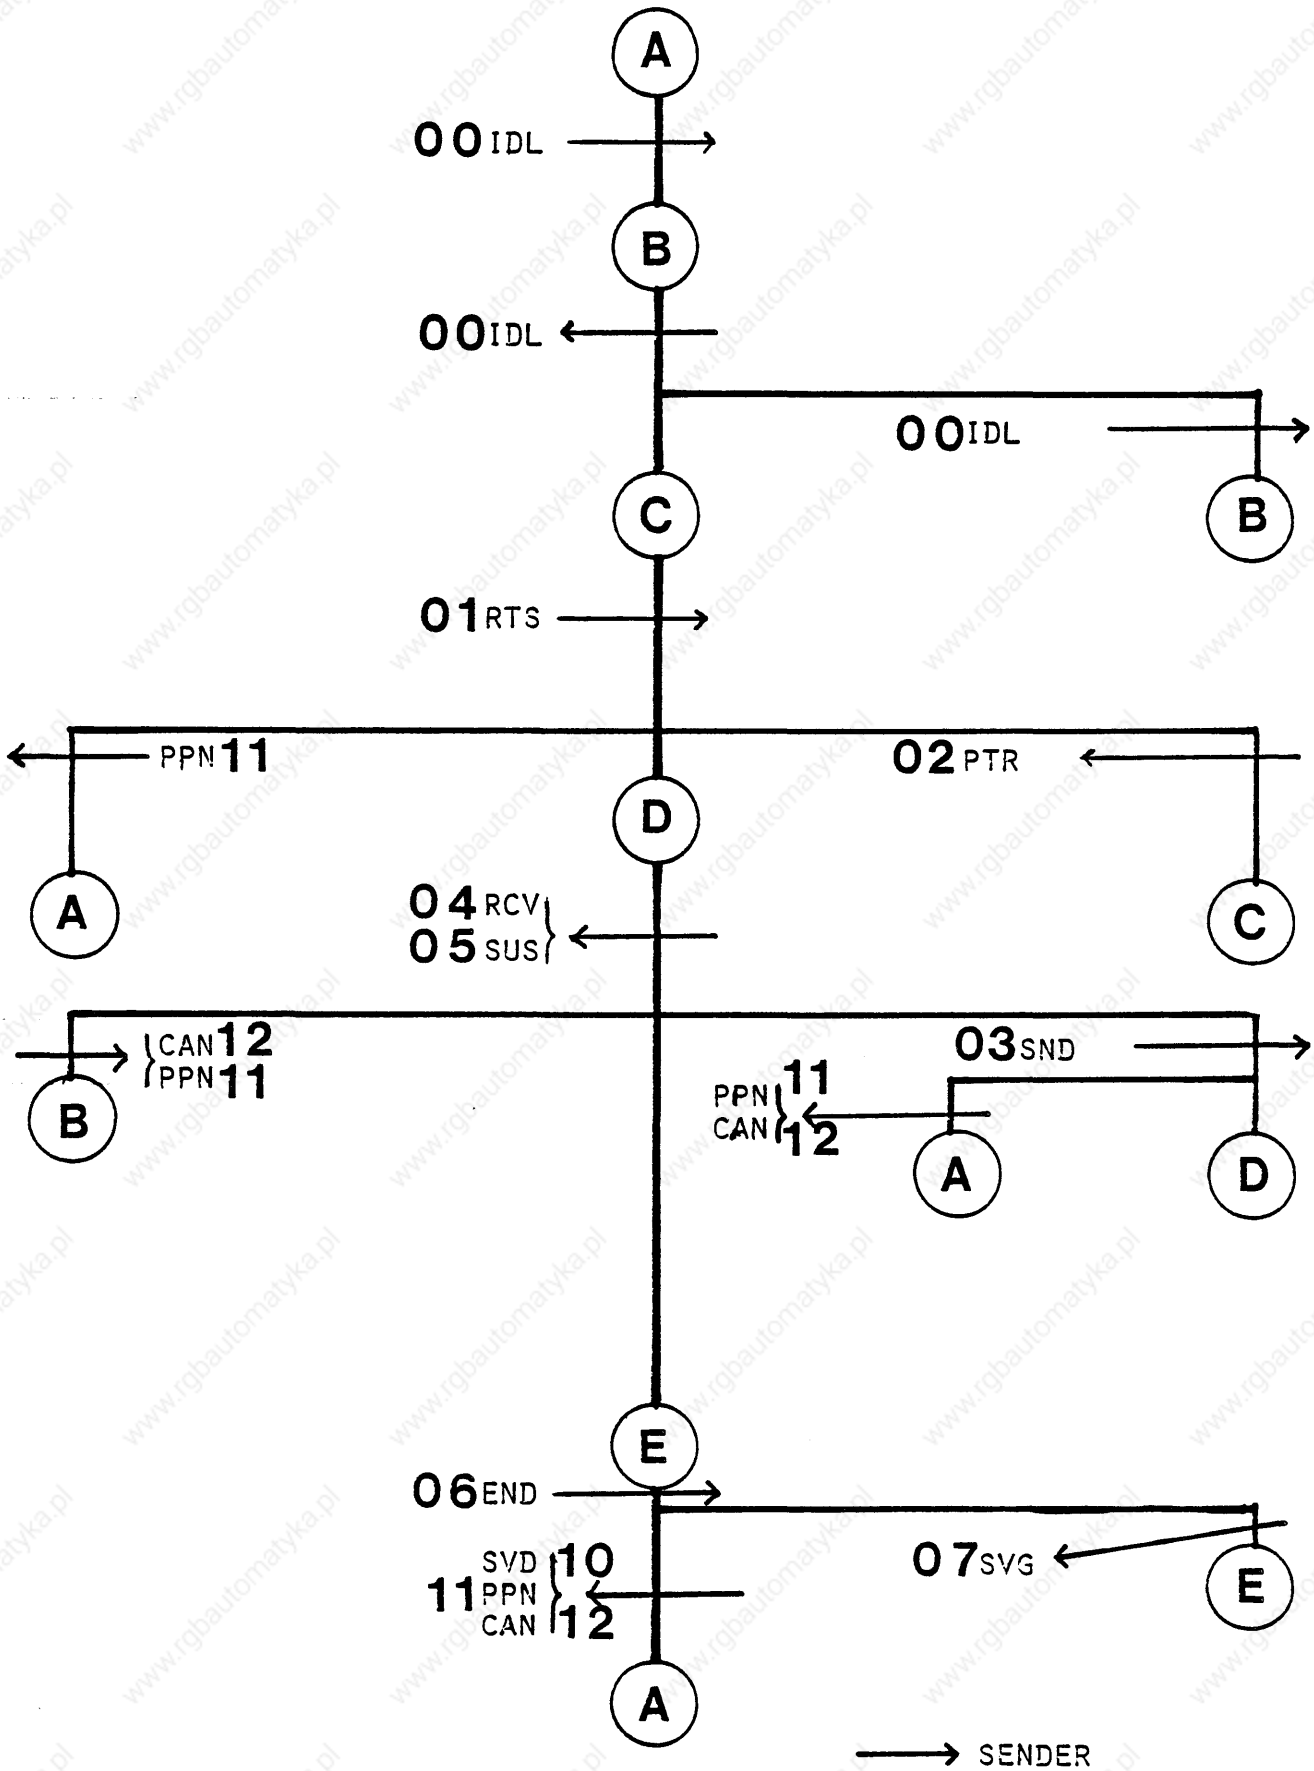
BASIC STREAM FLOW

- FRONT-END IS LOGGED ON
- COMMUNICATIONS IN AN IDLE STATE
- FRONT-END SENDS RTS(01) TO THE CRAY-1
- CRAY-1 SENDS RCV (04) TO THE FRONT END.
- FRONT-END SENDS SND (03) TO THE CRAY-1 ALONG WITH THE JOB DATASET
- CRAY-1 SENDS RCV (04) TO THE FRONT-END WHILE DECODING THE MESSAGE AND SAVING THE JOB DATASET
- FRONT-END SENDS END (06) TO THE CRAY-1 UNTIL CRAY-1 HAS SAVED THE DATASET.
- CRAY-1 SENDS SVD (10) TO THE FRONT-END ONCE DATASET HAS BEEN SAVED.
- FRONT-END AND CRAY-1 THEN KEEP COMMUNICATIONS OPEN BY ALTERNATELY SENDING AND RECEIVING IDL(00).



13

NOTE: A MCL SCB IS A LEGAL REQUEST OR RESPONSE AT ANY TIME. THE ONLY LEGAL REPLY TO MCL IS IDL.

STREAM CONTROL BYTE FLOW

SCP JOB STREAM FLOW

- EXAMINES THE DATASET HEADER MESSAGE AND DETERMINES THE DATASET IS A JOB DATASET.

- BUILDS DISK BUFFERS FROM STATION BUFFERS AND WHEN BUFFERS ARE FULL HAS THEM WRITTEN TO DISK.

- 'CRACKS' THE JOB CARD ASSIGNING DEFAULTS WHEN APPROPRIATE.

- MAKES APPROPRIATE ENTRIES IN THE JOB QUEUE (SYSTEM DATASET TABLE (SDT)), SUCH AS:

  DATASET NAME

  JOB NAME AND PRIORITY

  SOURCE AND DESTINATION ID

  DISPOSITION CODE SET TO JOB DATASET (IN)

- HAS THE DATASET MADE PERMANENT FOR THE LIFE OF THE JOB. (DSC)

BY [illegible] NAME

DISK QUEUE MANAGER (DQM)

- MANAGES ALLOCATION/DEALLOCATION OF MASS STORAGE (DISKS)
- MANAGES MASS STORAGE REQUEST QUEUES
- MANAGES MASS STORAGE CHANNELS, CONTROLLERS AND DISK UNITS.
- MAXIMUM OF 11 DISK CONTROLLERS (44 DSU's)
- UPDATES THE DEVICE RESERVATION TABLE (DRT) FOR EACH DSU.
- CALLED BY EXEC (UPON TRANSFER OF AN I/O SEGMENT) OR BY ANOTHER TASK (FOR DISK REQUEST).

DATASET ALLOCATION TABLE - DAT

A DAT exists for each dataset in the system. A DAT defines where a dataset logically resides on mass storage, i.e., on which logical device or devices, and what portions of each device.

The DAT page and entry header contains general dataset information.

The DAT partition header contains general information concerning a particular partition of the DAT. A partition represents a portion of a single logical device. Each allocation index (AI) in a partition is a bit number in the respective Device Reservation Table (DRT).

The DAT is composed of as many 16-word DAT pages as necessary to represent the mass storage occupied by the dataset. Additional DAT pages continue from the point at which the last DAT left off.

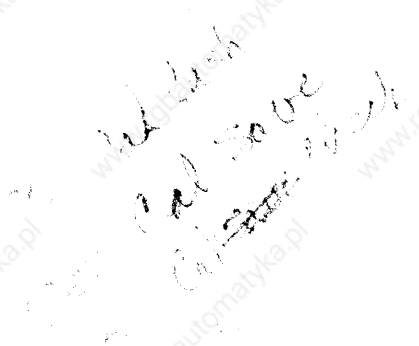
PERMANENT DATASET MANAGER (PDM)

www.rgbautomatyka.pl



PERMANENT DATASET MANAGER (PDM)

- PROVIDES FOR CREATING, ACCESSING, DELETING, MAINTAINING, AND AUDITING PERMANENT DATASETS.

- PERMANENT DATASETS MAY EXIST FOR USERS OR THE SYSTEM.

- USER PERMANENT DATASETS ARE CREATED UPON REQUEST BY A USER JOB. (SAVE)

- SYSTEM PERMANENT DATASETS ARE CREATED FOR SPOOLED INPUT AND OUTPUT DATASETS.

- A SYSTEM PERMANENT DATASET IS CREATED FOR JOB DATASETS ARRIVING FROM A FRONT-END. (SDT)

- A PERMANENT JOB DATASET IS DELETED UPON COMPLETION OF THE JOB.

JOB SCHEDULER (JSH)

JOB SCHEDULER (JSH)

- INITIATES JOB SCHEDULING
- MANAGES USER AREA MEMORY RESOURCES. (JTA-LA)
- MANAGES USER JOB SWAPPING.
- MANAGES ROLL-IN AND ROLL-OUT OF USER JOBS.
- INITIATED THROUGH CALLS BY OTHER TASKS.

JOB SCHEDULING

- JSH SELECTS JOBS FROM THE SYSTEM DATASET TABLE (DC=IN).
- JOBS ARE ENTERED ON THE JOB EXECUTION TABLE (JXT) BY CLASS, PRIORITY AND TIME OF SUBMISSION.
- A PRIORITY OF 0-15 MAY BE SPECIFIED ON THE JOB CARD.
- THERE CAN BE UP TO 63 ENTRIES ON THE JXT.
- JOBS ON THE JXT CONTEND FOR MEMORY BASED ON PRIORITY AND JOB SIZE. (EXCLUDING PRIORITY 0 JOBS).
- ONCE A WAITING JOB BECOMES THE HIGHEST MEMORY PRIORITY IT IS MOVED FROM THE DISK TO MEMORY.

USER JOB SWAPPING

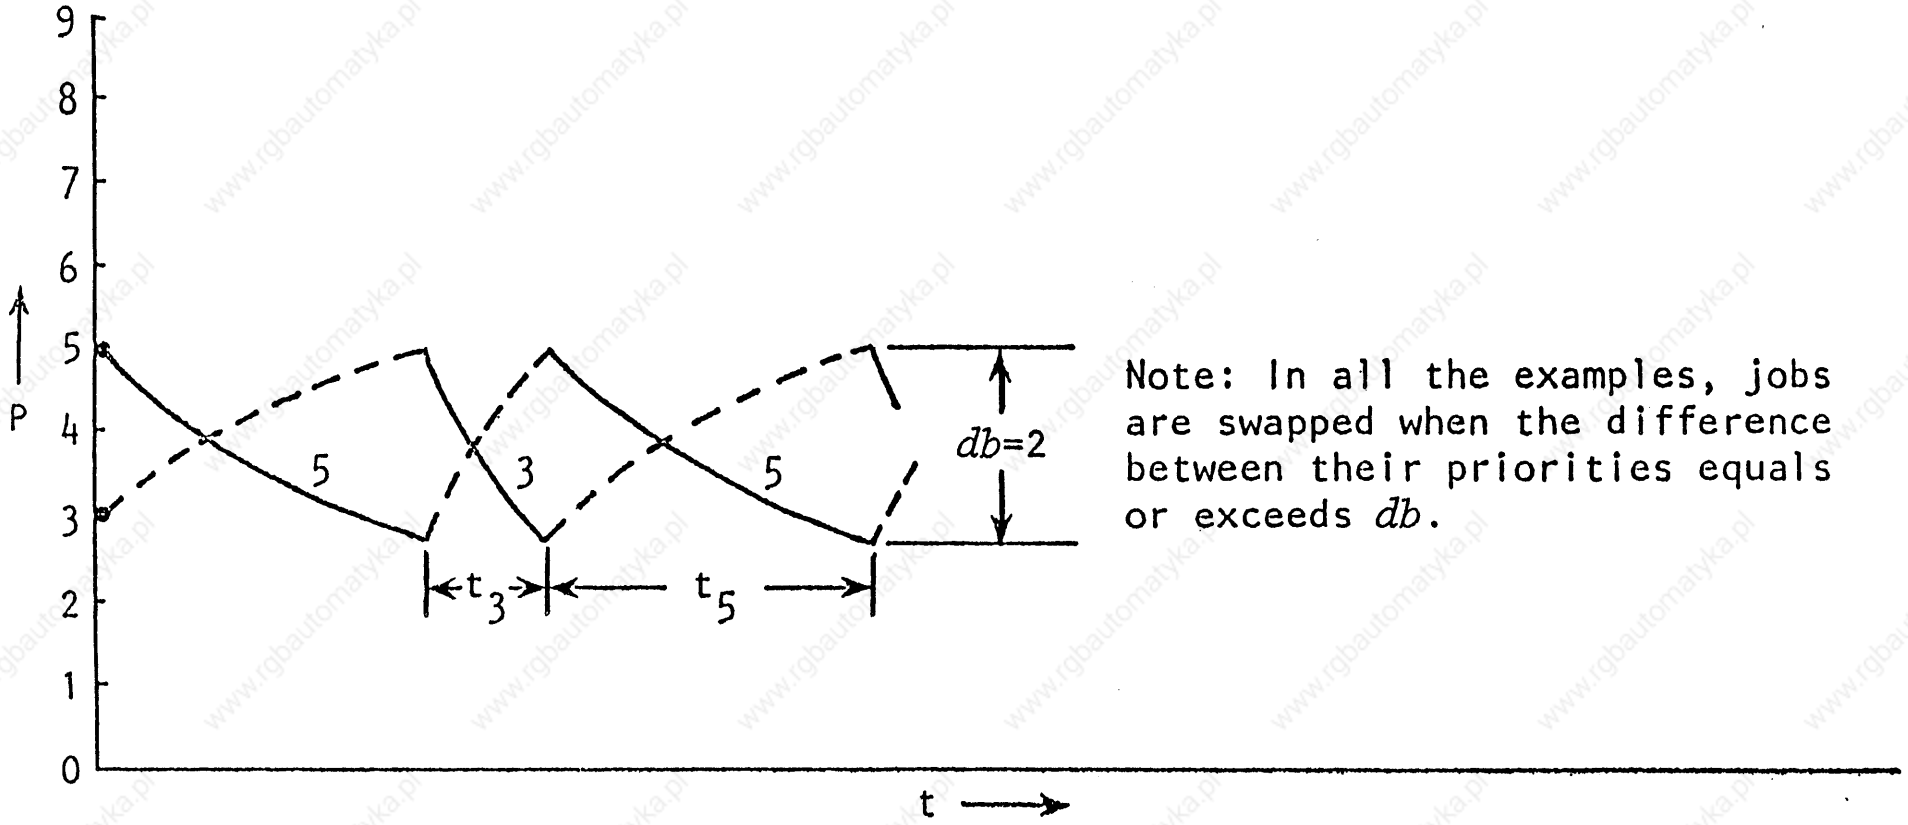
- ONCE IN MEMORY A JOB MUST CONTEND WITH OTHER JOBS IN MEMORY FOR CPU TIME.
- CPU PRIORITY FALLS WHEN A JOB IS CONNECTED TO THE CPU.
- CPU PRIORITIES ARE RECOMPUTED AFTER EACH SCHEDULING INTERVAL.
- CPU PRIORITY IS GIVEN TO JOBS THAT ARE STREAMING (DOING I/O).
- THE ALGORITHM FOR COMPUTING CPU PRIORITY IS ADJUSTABLE.

ROLL-OUT AND ROLL-IN OF JOBS

- MEMORY PRIORITY RISES WHILE A JOB IS WAITING FOR MEMORY
- MEMORY PRIORITY FALLS WHEN A JOB IS IN MEMORY AND EXECUTING
- HIGHER PRIORITY JOBS MAY PRE-EMPT MEMORY FROM LOWER PRIORITY JOBS, THEN:

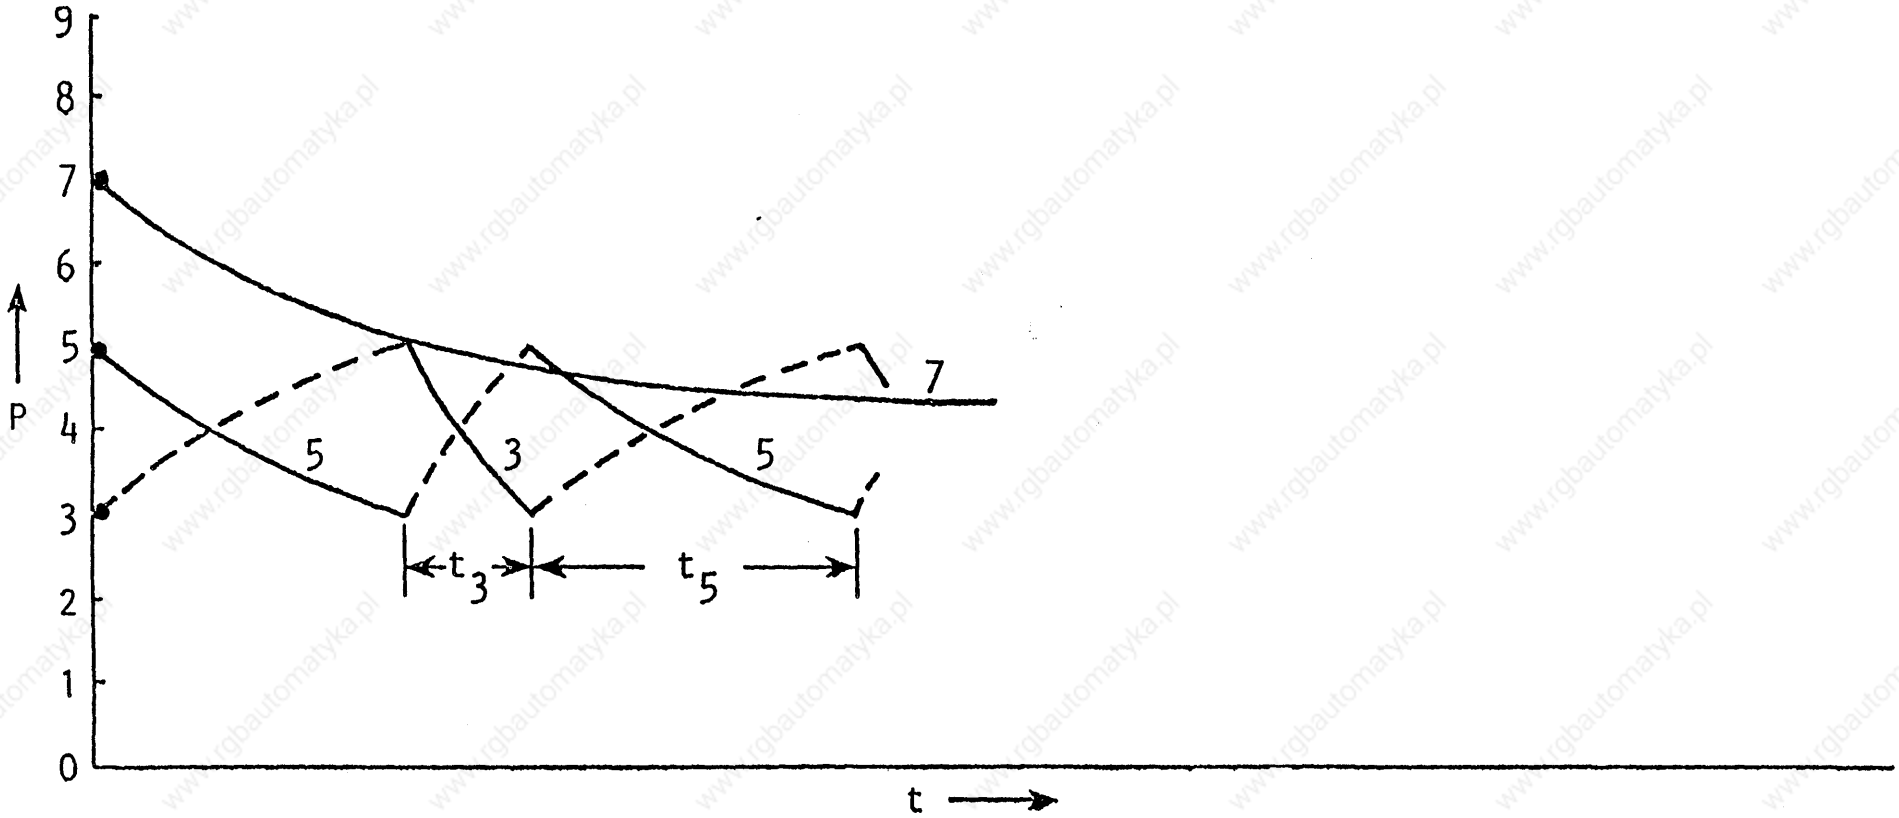
  THE LOWER PRIORITY JOB IS WRITTEN TO DISK (ROLLED-OUT).
  HIGHER PRIORITY JOB USES THE VACATED MEMORY.
  MEMORY MAY HAVE TO BE 'COMPACTED' SO HIGH PRIORITY JOB HAS A CONTIGUOUS AREA.

- ROLLED-OUT JOBS PRIORITY IS RISING SO EVENTUALLY IT WILL BE WRITTEN BACK TO MEMORY (ROLLED-IN).
- THE ALGORITHM FOR COMPUTING MEMORY PRIORITY IS ADJUSTABLE.
- ROLLED JOBS MAY BE CONTINUED OR RERUN AFTER A RESTART



Note: In all the examples, jobs are swapped when the difference between their priorities equals or exceeds *db*.

Showing two jobs which are too large to share memory. Their initial priorities (from the job cards) are 3 and 5. Note that the higher-priority job runs first and consistently enjoys a longer stay in memory, because its priority has asymptotes at P=2 and 8 (as opposed to 0 and 6 for the other job.)



Showing three jobs, only two of which can share memory at any one time. Except for the presence of the priority-7 job, this graph is identical to figure 3.8-2. The priority-7 job can never be forced out of memory because its priority never will be even as much as one unit below P=5, which is the maximum attainable by either of the other two jobs. (If its initial priority were 6 instead of 7, it still would never be forced out by the other two jobs.)

```

USER AREA MANAGEMENT

- PROVIDES FOR ROLL-IN, ROLL-OUT RESOURCES
- PROVIDES FOR INITIAL JOB ENTRY TO MEMORY
- PROVIDES DYNAMIC ALLOCATION OF MEMORY TO USER JOBS
- PROVIDES DYNAMIC DEALLOCATION OF MEMORY TO USER JOBS
- USES A TABLE (MST) FOR DETERMINING USEABLE MEMORY SPACE
- USES A 'FIRST-FIT' METHOD FOR GAINING MORE MEMORY
- 'FIRST-FIT' METHOD:

  ALLOCATES MEMORY (BY BLOCK) BEGINNING AT LOW END OF MEMORY

  MOVES JOBS (IF REQUIRED) BEGINNING AT HIGH END OF MEMORY

  ENCOURAGES LARGE BLOCKS OF FREE MEMORY AT THE HIGH END OF MEMORY

```

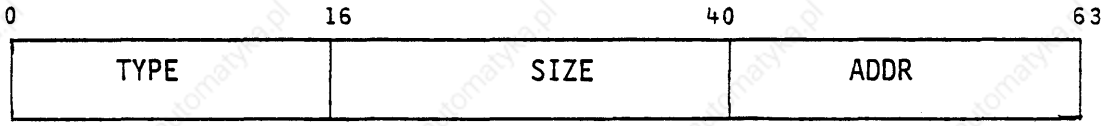
MEMORY SEGMENT TABLE - MST

The MST in STP memory contains a one-word entry for each segment of memory that has been allocated by the Job Scheduler plus additional entries that describe free segments. MST entries are stored in ascending order according to the beginning address of the segment (MSADDR). Any free space between two allocated segments is consolidated into a single entry. The last entry in the table is always followed by a zero word. To provide for the case where every allocated segment is surrounded by a free segment, the MST must have twice as many words in it as the maximum number of allocated segments, plus two more.



Memory Segment Table (MST) entry

Field	Word	Bits	Description
MSTYPE	0	0-15	Contains 0 if the segment is free; otherwise, it contains the JXT ordinal of the job to which the segment is allocated.
MSSIZE	0	16-39	Number of words in the segment. This is always a multiple of 1000_8.
MSADDR	0	40-63	STP-relative address of the first word in the segment. This is always a multiple of 1000_8.

JOB SCHEDULER JOB FLOW

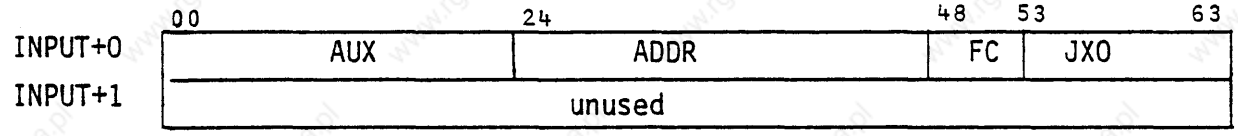
- JOB DATASET ENTERS THE SYSTEM
- STATION CALL PROCESSOR (SCP) HAS THE JOB SAVED ON DISK
- SCP HAS AN ENTRY MADE IN THE SYSTEM DATASET TABLE (SDT), AND DATASET CATALOG (DSC)
- JOB IS PLACED IN JOB EXECUTION TABLE (JXT) ACCORDING TO CLASS/ PRIORITY AND TIME OF SUBMISSION
- ONCE ON THE JXT THE JOB CONTENDS FOR MEMORY
- JOB MEMORY IS ERASED WHEN JOB INITIATED (I@ERASE)
- JOB IN MEMORY CONTENDS FOR CPU TIME
- JOB IN MEMORY MAY BE ROLLED OUT
- WHEN A JOB COMPLETES, ITS OUTPUT DATASETS ARE PLACED IN THE OUTPUT QUEUE IN SDT AND MADE PERMANENT
- WHEN FRONT-END ACKNOWLEDGES RECEIPT OF A DATASET THE DATASET CATALOG ENTRY IS REMOVED

Calling Sequence

JSH can be invoked from any other task by calling either TSKREQ or PUTREQ with the following instruction sequence:

Location	Result	Operand
	A1	calling task's ID
	A2	JSHID,0
	S1	function code (already shifted)
	S2	job's offset in JXT
	S1	S1!S2
[	S2	address if any]
[	S2	S2<D'16
[	S1	S1!S2]
[	S2	auxiliary information if any]
[	S2	S2<D'40
[	S1	S1!S2]
	R	TSKREQ or PUTREQ

Input register format:



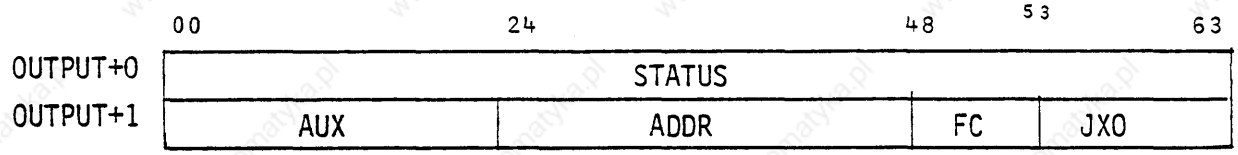
AUX Auxiliary information; unused by JSH. (Any value the caller places in INPUT+0 is returned verbatim in OUTPUT+1.)

ADDR Word address relative to the beginning of STP of an additional word or list of words if needed to fully specify the call.

FC Function code; use equated labels of the form J$XXXX, selected from table

JXO JXT offset for the job in question.

Output register format:



STATUS Status of requested function.

0 Requested function completely accomplished.

≠0 Error or system is unable to fulfill request completely.

PARTIAL JOB SCHEDULER FUNCTIONS

FUNCTIONS:
JSREQTAB

Function Code	Input Parameters	Function
—no input required—		Fill up JXT with jobs from SDT.
J$ABORT	JXO,CODE	Abort a job.
J$DELETE	JXO	Release all space allocated to a job.
J$RERUN	JXO	Same as J$DELETE but reinitiate a job.
J$ALLOC	JXO,ADDR	Allocate or release memory for a job.
J$IOSUSP	JXO	Suspend a job until an I/O request is done.
J$IODONE	JXO	Resume an I/O suspended job.
J$DELAY	JXO,ADDR	Suspend a job for a given time.
J$DELAYK	JXO,ADDR	Same as J$DELAY but keep the job in memory.
J$AWAIT	JXO,ADDR	Suspend a job until a given event occurs.
J$SUSP	JXO	Suspend a job momentarily; system initiated.
J$SUSPK	JXO	Same as J$SUSP but keep the job in memory.
J$REMK	JXO	Lift the "keep in memory" restriction.
J$RESUME	JXO	End momentary suspension.
J$STOP	JXO	Suspend a job indefinitely; operator action.
J$STPALL	JXO	Suspend all jobs indefinitely; operator action.
J$START	JXO	End an indefinite suspension for a job; operator action.
J$STRALL	JXO	End an indefinite suspension for all jobs; operator action.
J$CLEAR	JXO	Force the end of a job's suspension.
J$INDEX	JXO	Mark the job irrecoverable.
J$SHTDWN	JXO	Idle down job activity in preparation for a system interruption.
J$RCVR	JXO	Lift the suspension from jobs suspended by a J$SHTDWN or system interruption.

JOB STATUS AND STATE CHANGES

The status field

The 23-bit status field (JXSTAT) in each job's JXT entry is described in table 3.8-2. The bits labeled Q, R, X, I, U, L, S, O, and M are mutually exclusive. Generally, whichever one of them is set determines the job's state. The other bits modify the job's state.

If all of bits 3 through 22 are zero, the job is said to be waiting to be connected to the CPU (state W).

Table 3.8-2. Status bit assignments

Bit position in JXSTAT	Bit name	Corresponding job state	Interpretation (when bit is set)
0	K	*S*	Keep this job in memory; don't roll it out.
1	A	*any*	Abort pending; reason given in JXEPC.
2	H	*O*	Holding operator or shutdown suspension until RN is set.
3	O	*O*	Suspended (indefinitely) by operator.
4	S	*S*	Suspended (momentarily) by system.
5	T	*S*	Suspended until a given time elapses.
6	E	*S*	Suspended until a given event occurs.
7	M	*M*	Memory allocation is pending.
8	Q	*Q*	Queued up; waiting to be initiated.
9	R	*R*	Rolled out. The M bit may also be set.
10	X	*X*	Executing.
11	I	*I*	Dormant pending recall on I/O completion.
12	C	*any*	Rerun request in process.
13	D	*any*	Delete request in progress.
14	U	*U*	Unloading from memory to roll file.
15	L	*L*	Loading into a new memory area.
16	P	*U or L*	Unload or load initiation is pending.
17	Y	*M, Q or R*	Waiting for memory liberation.
18	Z	*M, Q or R*	Waiting for memory compaction.
19	B	*S*	Suspended (indefinitely) by recovery.
20	V	*I*	Waiting on INDEX write completion.
21	F	*I*	Waiting on rollfile write completion.
22	N	*M, Q or R*	Not in memory.

CPU SWAPPING

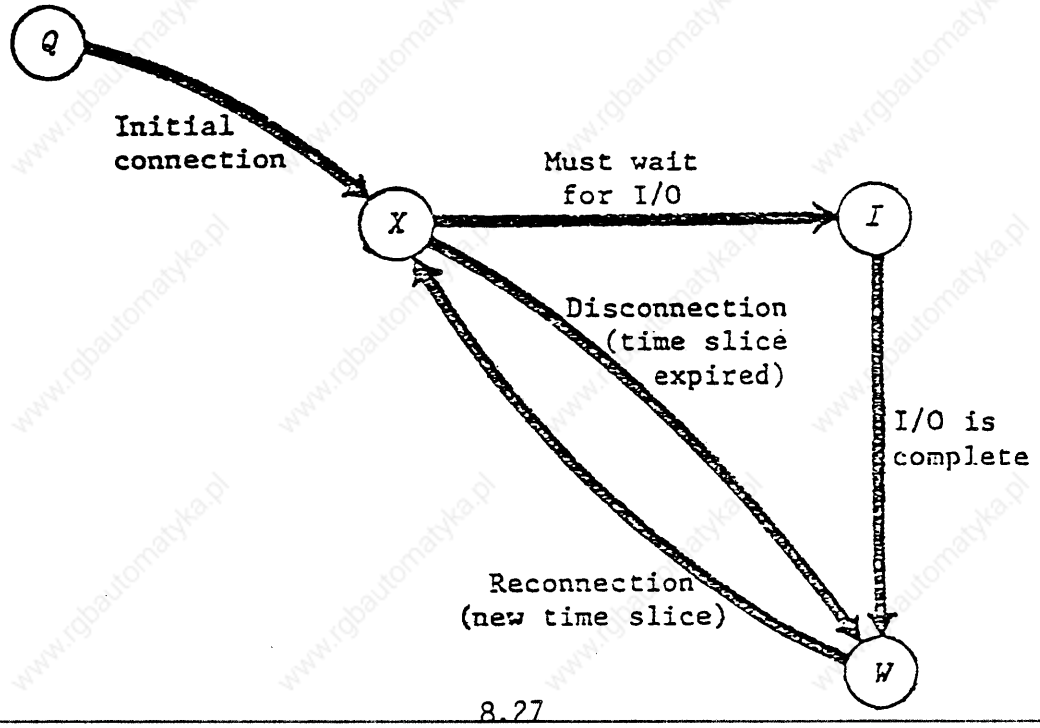
Q ⟶ X — A JOB IS QUEUED IN THE JOB EXECUTION TABLE (JXT) WAITING MEMORY. THE JOB IS BROUGHT INTO MEMORY AND BEGINS EXECUTION

X ⟶ I — THE JOB IS SUSPENDED PENDING COMPLETION OF I/O. THE CPU IS AVAILABLE FOR USE BY ANOTHER JOB.

I ⟶ W — THE I/O COMPLETES. THE JOB MAY WAIT FOR MORE CPU TIME.

W ⟶ X — JSH RECONNECTS THE WAITING JOB BECAUSE OF ITS HIGH PRIORITY

X ⟶ W — THE JOB'S TIME SLICE EXPIRES. THE CPU IS AVAILABLE FOR USE BY ANOTHER JOB.



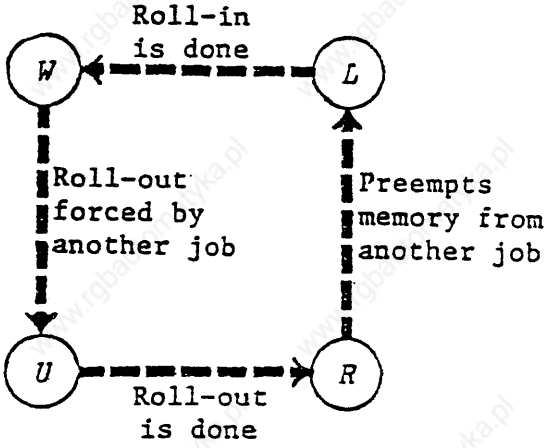
MEMORY SWAPPING

W→U I/O IS INITIATED FOR ROLL-OUT OF THE WAITING JOB.

U→R THE JOB IS ROLLED-OUT. THE JOB'S MEMORY IS AVAILABLE.

R→L I/O IS INITIATED FOR ROLL-IN OF THE JOB. MEMORY HAS BEEN ALLOCATED.

L→W THE JOB IS ROLLED-IN. THE JOB MAY WAIT FOR CPU TIME.



JOB SUSPENSION

	X → M	THE EXECUTING JOB MAKES A REQUEST FOR MORE MEMORY. IF REQUEST CANNOT BE SATISFIED THE JOB MAY BE ROLLED-OUT.
	M → W	THE ALLOCATION REQUEST WAS SATISFIED. THE JOB WAS NOT ROLLED OUT SO NOW MAY WAIT FOR CPU TIME
	M → U	I/O IS INITIATED FOR ROLL-OUT OF THE JOB REQUESTING MORE MEMORY
X → O	X → S	THE EXECUTING JOB REQUESTS SUSPENSION. JOB IS DISCONNECTED FROM CPU AND LIABLE TO BE ROLLED OUT.
O → OU	S → SU	I/O IS INITIATED FOR ROLL-OUT OF THE SUSPENDED JOB.
OU → OR	SU → SR	THE SUSPENDED JOB IS ROLLED-OUT. THE JOB'S MEMORY IS AVAILABLE.
OR → R	SR → R	THE SUSPENDED JOB IS REACTIVATED.
O → W	S → W	THE SUSPENDED JOB IN MEMORY IS REACTIVATED.

USER EXCHANGE PROCESSOR (EXP)

www.rgbautomatyka.pl

USER EXCHANGE PROCESSOR (EXP)

- PROCESSES ALL USER NORMAL ACTION REQUESTS.
- PROCESSES ALL USER ERROR EXITS.
- PROCESSES JSH REQUESTS TO INITIATE OR ABORT A USER JOB.
- ALL REQUESTS MADE THROUGH THE EXCHANGE PROCESSOR REQUEST WORD (JTEP) IN A USER JTA. JTEP IS WORD 67_8.

Field	Bits	Description
JTEPX	0-1	User exit 2 Normal exit 1 Error exit or execution error 0 Not user exit
JTEPC	2	Continuation flag
JTEPJ	3	Job Scheduler request flag
JTEPM	4	JTA expansion request flag
JTEPF	7-15	Exchange package flags
JTEPP	16-39	P register for errors
JTEPA	40-63	EXP Continuation address

USER NORMAL EXIT

- USER ISSUES A SYSTEM ACTION REQUEST WHICH SETS S REGISTERS AND ISSUES AN EX INSTRUCTION

  S0-DESIRED CALL TABLE OFFSET (FUNCTION CODE)

  S1-CONVENTION -- AN ADDRESS OF A USER TABLE (OPTIONAL)

  S2-FURTHER OPTIONAL ARGUMENT

- WHEN THE REQUEST IS COMPLETE THE USER'S S0-REGISTER IS SET

  S0-ZERO IF REQUEST COMPLETED NORMALLY

  S0-ERROR CODE OR JOB ABORTS

- EXP EXAMINES THE USERS JXT ENTRIES. A JXT ENTRY POINTS TO THE USERS JTA

- THE USERS JTA CONTAINS A COPY OF THE EXCHANGE PACKAGE

- EXP EXAMINES JTEP (WORD 67_8) AND THE USERS S0 REGISTER TO DETERMINE REQUEST

USER ERROR EXIT

- A JOB EXECUTES AN ERROR EXIT (ERR) INSTRUCTION OR ENCOUNTERS A HARDWARE DETECTED ERROR
- EXP ISSUES APPROPRIATE ERROR MESSAGES
- EXP MAY INITIATE JOB ABORT OR REPRIEVE PROCESSING
- EXP MAY SEARCH THE REMAINING JOB CONTROL STATEMENTS FOR AN EXIT OR END-OF-FILE
- IF EXIT IS FOUND EXP EXAMINES THE NEXT STATEMENT
- IF THE NEXT STATEMENT IS 'DUMPJOB' A DATASET NAMED $DUMP IS WRITTEN TO DISK IN BINARY
- $DUMP IS A BINARY UNBLOCKED DATASET AND CONTAINS THE JTA AND ENTIRE USER FIELD (BA-LA) OF THE ABORTED JOB
- $DUMP MAY THEN BE USED BY THE 'DUMP' CONTROL STATEMENT TO OUTPUT VARIOUS AREAS OF THE ABORTED PROGRAM
- IF REPRIEVE PROCESSING, EXP TRANSFERS CONTROL BACK TO THE USER JOB AT THE ADDRESS SPECIFIED IN THE REPRIEVE MACRO

MESSAGE PROCESSOR (MSG)

MESSAGE PROCESSOR (MSG)

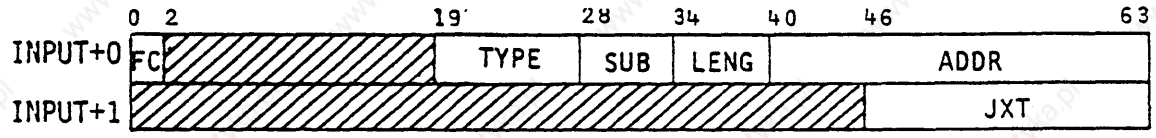
- WRITES MESSAGES IN THE SYSTEM AND USER LOG FILES.
- CAN BE CALLED BY OTHER TASKS AND USERS(THROUGH EXP).
- MSG USES TIO WHEN PERFORMING I/O.
- THE SYSTEM LOG CAN BE ANALYZED BY THE 'EXTRACT' PROGRAM.
- USERS CAN ENTER MESSAGES IN THE SYSTEM AND/OR USER LOG.

SYSTEM LOG PROCESSING

- THE SYSTEM LOG IS A PERMANENT DATASET NAMED $SYSTEMLOG
- THE SYSTEM LOG BUFFER AND DSP ARE ALLOCATED IN HIGH MEMORY.
- A TASK CALLS MSG THROUGH THE TSKREQ ROUTINE WITH THE FOLLOWING REGISTERS SET:

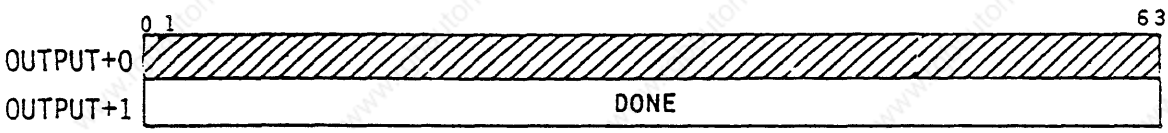
(A1) ID of task requesting message entry
(A2) MSGID,0
(S1) INPUT+0 } request
(S2) INPUT+1 }

Request format:



Field	Word	Bits	Description
FC	INPUT+0	0-1	Function code: 1 Write message in user's logfile only 2 Write message in SYSTEMLOG only 3 Write message in both user's logfile and in SYSTEMLOG
TYPE	INPUT+0	19-27	Major class of log record
SUB	INPUT+0	28-33	Subtype of log record
LENGTH	INPUT+0	34-39	Length in words of message. If length is 0, the message is a character string terminated by a zero byte in the low-order eight bits.
ADDR	INPUT+0	40-63	Starting address relative to STP of message to be written
JXT	INPUT+1	46-63	JXT address if message associated with job; otherwise 0

Reply format:



Field	Word	Bits	Description
DONE	OUTPUT+1	0-63	Characters 'MSG DONE' in ASCII

USER LOG PROCESSING

- THE USER LOG ($LOG) IS CREATED BY JSH FOR EACH USER JOB.
- THE USER LOG BUFFER IS IN THE JOB's JTA.
- THE USER CALLS MSG VIA THE 'MESSAGE' MACRO:

MESSAGE - ENTER MESSAGE IN LOGFILE

The printable ASCII message at the location specified in the macro call is entered in the job and system logfile. The message must be 1-80 characters terminated by a zero byte. A flag, *loc*, indicates the destination for the message.

Format:

Location	Result	Operand
	MESSAGE	*address,loc*

address A symbol or an A, S, or T register that contains the address.

loc Destination for message. May be any of the following:

- U User logfile only
- S System logfile only
- US User and system logfiles; default, if *loc* is blank.

MEMORY ERROR PROCESSOR (MEP)

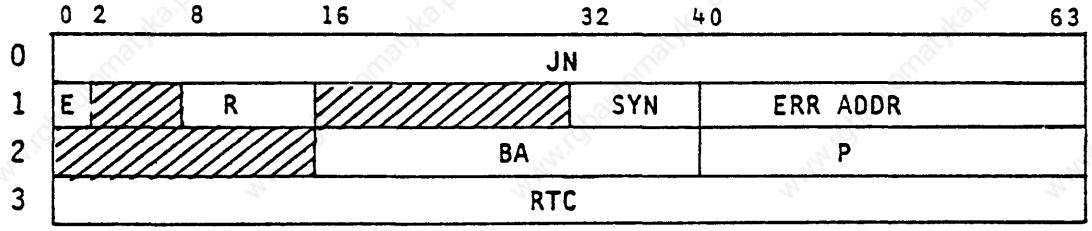
DISK ERROR CORRECTION (DEC)

www.rgbautomatyka.pl

MEMORY ERROR PROCESSOR (MEP)

- PURPOSE IS TO RELAY MEMORY ERROR INFORMATION FROM EXEC TO MSG.

- MESSAGES FROM EXEC TO MSG ARE IN THE FORMAT:



Field	Word	Bits	Significance
JN	0	0-63	Jobname or 'STP'
E	1	0,1	Error type (binary): 10 Uncorrectable memory error 01 Correctable memory error
R	1	8-15	Read mode: 0 Scalar 1 I/O 2 Vector 3 Fetch
SYN	1	32-39	Syndrome bits
ERR ADDR	1	40-63	Error address
BA	2	26-39	Base address
P	2	40-63	Program address
RTC	3	0-63	Real-time clock

DISK ERROR CORRECTION (DEC)

- ATTEMPTS CORRECTION OF A DATA ERROR FROM DISK.
- USES CYCLIC REDUNDANCY CHECKWORDS (CRC) FOR ERROR CORRECTION.
- DQM SCHEDULES DEC IF NORMAL RECOVERY PROCEDURES ARE UNSUCCESSFUL.
- DQM PASSES THE EQT ADDRESS WHICH CONTAINS THE VALID CHECKWORDS.
- DEC PROCESSES ONE DISK ERROR AT A TIME.
- REFER TO MASS STORAGE SUBSYSTEM REFERENCE MANUAL 2240630 FOR THE CRC ALGORITHM.

SYSTEM PERFORMANCE MONITOR

SYSTEM PERFORMANCE MONITOR

- MEASURES OVERALL SYSTEM PERFORMANCE
- INVOKED ON A TIME DELAY BASIS
- DELAY INTERVAL BETWEEN COLLECTIONS IS (I@SPMDLY)
- USES MESSAGE TASK TO WRITE SYSTEM TIMES TO THE SYSTEMLOG
- USES POOL 1 AS A BUFFER FOR THE SYSTEM TIMES
- MEASUREMENTS COLLECTED BY SPM INCLUDE

OVERLAY MANAGER

OVERLAY MANAGER (OVM)

- CONTROLS THE LOADING OF TASK OVERLAYS.

- EACH TASK USING OVM MUST RESERVE A MEMORY AREA SUFFICIENT TO HOLD ONE OR MORE DISK BLOCKS (512 WORDS) AS AN OVERLAY AREA.

- OVERLAYS MAY BE NESTED UP TO TEN DEEP, THAT IS OVERLAY X MAY CALL OVERLAY Y, ETC.

- AN OVERLAY MAY CALL ANOTHER OVERLAY WITH OR WITHOUT RETURN REQUESTED TO ITSELF.

- ONCE IN MEMORY AN OVERLAY MAY OR MAY NOT BE RELOADED FROM DISK DEPENDENT ON CHANGES IN INTERNAL CODING OR TABLES WITHIN THE OVERLAY.

- EACH CALLED OVERLAY OVERWRITES THE TASKS OVERLAY AREA WITH THE REQUESTED OVERLAY.

JOB CLASS MANAGER

JOB CLASS MANAGER (JCM)

- VALIDATES JOB CLASS QUALIFICATIONS AND ASSIGNS A JOB TO A CLASS.

- LINKS JOB INPUT QUEUE ENTRIES IN THE SDT BY CLASS RANK, JOB PRIORITY, AND TIME SUBMITTED.

- OPTIONALLY REPLACES EACH JOB STATEMENT PRIORITY WITH THE CLASS RANK PRIORITY.

- ASSIGNS THE NUMBER OF AVAILABLE JOB EXECUTION TABLE (JXT) ENTRIES FOR EACH SPECIFIED JOB CLASS.

- ONCE A JOB HAS A JOB EXECUTION TABLE (JXT) ENTRY, ITS CLASS ASSIGNMENT DOES NOT CHANGE UNLESS THE JOB IS RERUN.

- A USER MAY LOWER A JOB CLASS THROUGH A PARAMETER IN THE JOB CONTROL STATEMENT.

- ENABLED/DISABLED THROUGH OPERATOR COMMANDS.

TAPE QUEUE MANAGER

TASK TO BE PROVIDED

CONTROL STATEMENT PROCESSOR (CSP)

CONTROL STATEMENT PROCESSOR (CSP)

- BINARY COPY OF CSP RESIDES IN MEMORY IMMEDIATELY ABOVE STP OR OPTIONALLY ON DISK(S).

- WHEN A USER JOB IS SUBMITTED JSH CALLS EXP TO COPY CSP INTO THE USER FIELD (AT BA+200_8).

- CSP EXECUTES IN THE USER FIELD AND IS SUBJECT TO USER JOB STATES.

- CSP SHARES THE USER TABLES SUCH AS THE JTA, JCB, DSP's, ETC.

- CSP 'CRACKS' USER CONTROL STATEMENTS.

- CSP ENTERS MESSAGES INTO THE LOGS THROUGH THE MESSAGE MACRO.

EXAMPLE

THE CONTROL STATEMENT

```
ASSIGN(DN=MYFILE,BS=25)
```

IS STORED IN THE JCB AS FOLLOWS:

0								
5	A	S	S	I	G	N	(	D
	N	=	M	Y	F	I	L	E
	,	B	S	=	2	5	)	0

DISPOSE,DN=COPY,SDN=BACKUP,DC=ST,MF=A.
EXIT.
EOF.
```

1. JOB IS STAGED FROM FRONT-END TO CRAY-1.

2. STATION CALL PROCESSOR (SCP) RECEIVES JOB AND PLACES IT IN THE SYSTEM DATASET TABLE (SDT) WHICH IS THE INPUT QUEUE FOR JOB SCHEDULER. SCP ALSO SAVES JOB IN THE DATASET CATALOG (DSC).

3. JOB SCHEDULER PICKS THE JOB FOR EXECUTION FROM SDT AND THEN MAKES AN ENTRY FOR THE JOB IN THE JOB EXECUTION TABLE AND ALLOCATES MEMORY.

4. JOB SCHEDULER CONNECTS THE JOB TO CPU.

5. CONTROL STATEMENT PROCESSOR (CSP) CRACKS THE ACCESS CARD, CALLS THE EXCHANGE PROCESSOR (EXP) TO VERIFY PERMISSIONS TO ACCESS MASTERFILE.

6. CSP CRACKS THE ASSIGN CARD, CALLS EXP TO OPEN TEMP, AND CHANGE THE BUFFER SIZE TO 12 INSTEAD OF 4 BLOCKS.

7. CSP CRACKS THE COPYD CARD, CALLS EXP TO LOAD PROGRAM COPYD FROM THE SYSTEM DIRECTORY.

8. COPYD EXECUTES, I/O BOUND, STREAMING DATA FROM TEMP TO COPY.

9. JOB SCHEDULER RECOGNIZES THAT JOB'EXAMPLE' IS STREAMING AND CONNECTS EXAMPLE TO THE CPU WHENEVER A BLOCK IS AVAILABLE IN THE INPUT CIRCULAR BUFFER.

10. CSP CRACKS THE DISPOSE STATEMENT, CALLS EXP.

11. EXP WRITES AN ENTRY FOR BACKUP IN THE SDT OUTPUT QUEUE.

12. SCP STAGES BACKUP TO MAINFRAME A.

13. DEPENDING ON MAINFRAME A, SCP DELETES ENTRIES FOR BACKUP IN THE SDT AND DSC.

14. CSP CRACKS EXIT STATEMENT, CALLS EXP TO TERMINATE THE JOB.

15. EXP SEARCHES FOR $OUT, COPIES $LOG TO $OUT (EXTENDING $OUT), CHANGES $OUT's DATASET NAME TO JOBNAME.

16. JOB TERMINATION CHANGES ENTRIES IN THE DSC AND SDT OUTPUT QUEUE FOR DATASET EXAMPLE.

17. SCP STAGES EXAMPLE TO MAINFRAME A, ETC.

18. JOB TERMINATION RELEASES ALL LOCAL DATASETS, DELETES $CS, AND TERMINATES JOB.

SYSTEM INTERACTION

JOB ENTRY

1. THE STATION CALL PROCESSOR (SCP) TASK EXAMINES A DATASET HEADER MESSAGE AND DETERMINES A JOB DATASET IS ENTERING THE SYSTEM.

   SCP MOVES THE SEGMENT BUFFER TO THE DISK BUFFER EACH TIME THE SEGMENT BUFFER BECOMES FULL FROM INPUT OF THE SUBSEGMENTS.

   SCP REQUESTS THE JOB DATASET DISK BUFFER BE WRITTEN TO DISK BY THE DISK QUEUE MANAGER (DQM) TASK.

2. THE DISK QUEUE MANAGER (DQM) TASK ALLOCATES DISK SPACE FOR THE JOB DATASET ON THE INITIAL CALL, AND HAS THE DISK BUFFER WRITTEN TO DISK VIA THE DISK DRIVER.

3. UPON REQUEST FROM THE STATION CALL PROCESSOR (SCP) TASK, THE JOB CLASS MANAGER (JCM) TASK DETERMINES WHICH JOB CLASS QUEUE ON THE SYSTEM DATASET TABLE (SDT) THE JOB SHOULD BE ENTERED IN.

4. UPON REQUEST FROM THE STATION CALL PROCESSOR (SCP) TASK, THE PERMANENT DATASET MANAGER (PDM) TASK CREATES A PERMANENT DATASET STRUCTURE FOR THE JOB AND SETS THE DISPOSITION CODE (DC) EQUAL TO ASCII CHARACTERS IN.

5. THE JOB SCHEDULER (JSH) TASK SELECTS THE HIGHEST PRIORITY JOB FROM THE INPUT QUEUE WHOSE JOB CLASS HAS A JOB EXECUTION TABLE (JXT) ENTRY AVAILABLE.

   JSH CONSTRUCTS THE JOBS JXT ENTRY AND CHANGES THE SYSTEM DATASET TABLE (SDT) INPUT QUEUE ENTRY TO EXECUTE QUEUE AND SETS THE JOB STATE TO THE QUEUED (Q) STATE IN THE JXT.

INITIAL JOB PREPARATION

1. THE JOB SCHEDULER (JSH) TASK SELECTS A JOB FROM THE JOB EXECUTING TABLE (JXT) THAT HAS BEEN GIVEN ITS INITIAL MEMORY ALLOCATION.

2. THE JOB SCHEDULER (JSH) ZEROES OUT THE JOB TABLE AREA (JTA) AND JOB COMMUNICATION BLOCK (JCB) OF THE JOB.

3. THE JOB SCHEDULER (JSH) INITIALIZES THE JOB COMMUNICATION BLOCK (JCB) POINTERS SUCH AS HLM, FL, DSP, ETC. AND SAVES THE POINTER TO THE JCB IN THE JOB TABLE AREA (JTA).

4. THE JOB SCHEDULER CREATES DATASET NAME TABLE (DNT) ENTRIES FOR $CS, $LOG, $IN, AND $OUT IN THE USERS JOB TABLE AREA (JTA).

5. THE JOB SCHEDULER INITIALIZES THE JOBS ROLLFILE DATASET NAME TABLE (DNT) ENTRY AT THE END OF THE JOB EXECUTION TABLE (JXT) ENTRY.

6. THE JOB SCHEDULER INITIALIZES THE ROLL JOB INDEX (RJI) TABLE ENTRY FOR THE JOB FOR POSSIBLE RECOVERY.

7. THE JOB SCHEDULER (JSH) SETS THE JOBS STATE TO WAITING (W) IN THE JXT THUS ALLOWING THE JOB TO CONTEND FOR THE CPU ALONG WITH OTHER ACTIVE JOBS IN THE JXT.

JOB ROLLOUT

1. THE JOB SCHEDULER (JSH) TASK DETERMINES A NEED BY A JOB FOR USER MEMORY AND CREATES A REQUEST TO HAVE ANOTHER JOB IN MEMORY ROLLED-OUT.

   JSH SEARCHES THE JOB EXECUTION TABLE (JXT) FOR A CANDIDATE FOR JOB ROLL-OUT.

   JSH AFTER LOCATING A CANDIDATE MAY HAVE TO COMPACT MEMORY TO OBTAIN A LARGE ENOUGH FREE SEGMENT OF MEMORY.

   JSH SETS THE PROPER JOB STATES OF THE WAITING JOB AND THE JOB ABOUT TO BE ROLLED-OUT.

2. THE DISK QUEUE MANAGER (DQM) TASK ALLOCATES DISK SPACE IF NEEDED, AND HAS THE MEMORY RESIDENT JOB AREA WRITTEN TO DISK VIA THE DISK DRIVER.

3. THE JOB SCHEDULER (JSH) TASK UPDATES THE MEMORY SEGMENT TABLE (MST).

4. THE JOB SCHEDULER (JSH) TASK LIFTS THE SUSPENSION ON THE JOB WAITING FOR MEMORY LIBERATION.

ACCESS A PERMANENT DATASET

1. A JOB MAKES A REQUEST FOR PERMISSION TO USE A PERMANENT DATASET.

2. THE EXCHANGE PACKAGE PROCESSOR (EXP) TASK EXAMINES THE REQUEST FOR VALID PARAMETERS AND ISSUES A REQUEST TO THE PERMANENT DATASET MANAGER (PDM) TASK FOR ACCESS AND THE JOB SCHEDULER (JSH) TASK FOR JOB SUSPENSION.

3. THE PERMANENT DATASET MANAGER (PDM) TASK VALIDATES ACCESS TO THE SELECTED DATASET FOR THE USER JOB.

   PDM MANAGES THE NECESSARY SYSTEM TABLES SO THAT THE USER HAS THE DESIRED PERMISSIONS GRANTED.

   PDM CREATES A PERMANENT DATASET TABLE (PDS) ENTRY FOR THE ACTIVE DATASET.

   PDM CREATES A DATASET NAME TABLE (DNT) ENTRY FOR THE USER AND INSURES THE DATASET ALLOCATION TABLE (DAT) FOR THE DATASET IS MADE RESIDENT IN THE REQUESTING JOB AREA THUS MAKING THE DATASET LOCAL FOR THAT JOB.

4. THE JOB SCHEDULER (JSH) TASK SETS THE JOBS STATUS BIT TO SUSPK (K) THUS DISALLOWING THE JOB FROM ROLL-OUT AND MEMORY MOVEMENT UNTIL THE JOBS DATASET ALLOCATION TABLE (DAT) ENTRY IS READ INTO THE USER AREA FROM THE DISK DATASET CATALOG (DSC).

   JSH RESETS THE JOBS STATUS TO THE WAIT (W) STATE FOLLOWING COMPLETION OF GENERATION OF THE LOCAL DATASET BY THE PERMANENT DATASET MANAGER (PDM) TASK.

DATASET ACQUISITION

1. A JOB MAKES A REQUEST TO ACQUIRE A PERMANENT DATASET.

2. THE EXCHANGE PACKAGE PROCESSOR (EXP) TASK EXAMINES THE REQUEST FOR VALID PARAMETERS AND ISSUES A REQUEST TO THE PERMANENT DATASET MANAGER (PDM) TASK TO SEARCH FOR AN EXISTANT PERMANENT DATASET.

   IF THE DATASET ALREADY EXISTS IN THE SYSTEM, THE FLOW FOLLOWS ACCESS PROCESSING.

   IF THE DATASET DOES NOT EXIST WITHIN THE SYSTEM EXP ISSUES A REQUEST TO THE JOB SCHEDULER (JSH) TASK TO SUSPEND THE JOB AND EXP ENQUEUES THE DATASET NAME AND PLACES IT ON THE REQUEST QUEUE IN THE SYSTEM DATASET TABLE (SDT).

3. THE PERMANENT DATASET MANAGER (PDM) TASK SEARCHES THE DATASET CATALOG (DSC) FOR AN EXISTANT DATASET AND IF SO TO VERIFY THE PERMISSION WORDS.

   PDM MONITORS NECESSARY TABLES AND USER AREAS ENABLING THE DATASET TO BECOME LOCAL TO THE JOB THAT ISSUED THE ACQUIRE AS IN THE ACCESS FLOW.

4. IF THE JOB SCHEDULER (JSH) TASK WAS REQUESTED IT SUSPENDS THE JOB AWAITING THE DATASET TRANSFER FROM THE FRONT-END.

5. IF THE DATASET IS NOT CRAY RESIDENT THE STATION CALL PROCESSOR (SCP) TASK SELECTS THE REQUEST ENTRY FROM THE SYSTEM QUEUE AND COMMUNICATES WITH THE FRONT-END VIA THE FRONT-END DRIVER TO RETRIEVE THE NON-RESIDENT DATASET.

   SCP THEN COMMUNICATES WITH THE JOB SCHEDULER (JSH), THE PERMANENT DATASET MANAGER (PDM) AND THE DISK QUEUE MANAGER (DQM) TO INSURE PROPER SAVING OF THE DATASET AND JOB ADVANCEMENT.

LOCAL I/O

1. A JOB ISSUES A WRITE REQUEST THROUGH A SYSTEM MACRO CAUSING PHYSICAL I/O.

2. THE EXCHANGE PACKAGE PROCESSOR (EXP TASK EXAMINES THE REQUEST FOR VALID PARAMETERS AND FORWARDS THE REQUEST FOR I/O.

3. THE TASK I/O (TIO) ROUTINES TRANSFER DATA, INSERTING RCW's WHERE NEEDED, FROM THE JOB DATA AREA TO THE JOB DISK BUFFERS ON A WRITE.

   TIO DETERMINES THE DISK BUFFERS ARE GREATER THAN HALF FULL AND PERFORMS CIRCULAR I/O (CIO).

   CIRCULAR I/O (CIO) ISSUES A WRITE REQUEST OF THE DISK QUEUE MANAGER (DQM) TASK AND HAS THE JOB SUSPENDED, STATE I, BY THE JOB SCHEDULER (JSH).

4. THE DISK QUEUE MANAGER (DQM) TASK ALLOCATES DISK ON A WRITE IF NEEDED, AND PERFORMS THE I/O VIA THE DISK DRIVER.

JOB MEMORY REQUEST

1. A JOB MAKES A REQUEST TO ALLOCATE/DEALLOCATE MEMORY THROUGH AN RFL CONTROL STATEMENT.

2. THE EXCHANGE PACKAGE PROCESSOR (EXP) EXAMINES THE USERS JOB COMMUNICATION BLOCK (JCB) FOR VALID PARAMETERS SUCH AS HLM, FL, ETC.

   EXP REQUESTS THE JOB SCHEDULER (JSH) TASK FOR THE ACTUAL ALLOCATE/DEALLOCATE OF MEMORY.

3. THE JOB SCHEDULER (JSH) TASK UPON A DEALLOCATE REQUEST MUST UPDATE USER FIELDS SUCH AS LA, HLM, DSP POINTERS, ETC.

   JSH RETURNS THE RELEASED MEMORY TO THE SYSTEM BY UPDATING THE MEMORY SEGMENT TABLE (MST) AND FILLING THE RETURNED MEMORY WITH THE CONTENTS OF I@ERASE SHIFTED LEFT 24 BITS.

4. THE JOB SCHEDULER (JSH) TASK UPON AN ALLOCATE REQUEST MUST SEARCH THE MEMORY SEGMENT TABLE (MST) FOR FREE MEMORY.

5. IF FREE MEMORY IS FOUND ADJACENT TO THE USER JOB THE MEMORY MAY BE GIVEN TO THE USER BY UPDATING VARIOUS USER FIELDS SUCH AS LA, HLM, ETC. AND UPDATING THE MEMORY SEGMENT TABLE (MST).

6. IF THE JOB SCHEDULER (JSH) TASK IN ITS SEARCH OF THE MEMORY SEGMENT TABLE (MST) CANNOT FIND MEMORY ADJACENT TO THE USER JOB, MEMORY COMPACTION OR ROLL-OUT MAY HAVE TO BE USED.

   IF SUCH IS THE CASE THE REQUESTING JOB IS SET TO THE WAITING (W) STATE AND THE REQUESTING JOB ITSELF BECOMES SUBJECT TO ROLL-OUT.

JOB TERMINATION

1. A JOB TERMINATES WITH AN EXIT CONTROL STATEMENT INTERPRETED BY THE CONTROL STATEMENT PROCESSOR (CSP).

2. CSP POSTS TERMINATION MESSAGES TO THE LOGFILES VIA THE MESSAGE (MSG) TASK.

3. THE EXCHANGE PACKAGE PROCESSOR (EXP) TASK COPIES THE JOBS $LOG TO $OUT.

   EXP CHANGES $LOG TO SCRATCH AND RELEASES SCRATCH DATASETS AS WELL AS $IN, $CS.

4. THE PERMANENT DATASET MANAGER (PDM) CREATES A DATASET CATALOG ENTRY (DSC) FOR EACH JOB OUTPUT DATASET THUS MAKING THE DATASET PERMANENT.

5. EXP HAS CREATED ENTRIES FOR THE JOBS OUTPUT DATASETS IN THE SDT.

6. THE DISK QUEUE MANAGER (DQM) TASK ALLOCATES DISK FOR $OUT IF NEEDED, AND HAS THE BUFFER WRITTEN TO DISK VIA THE DISK DRIVER.

7. THE JOB SCHEDULER (JSH) TASK TERMINATES THE JOB BY RELEASING THE EXECUTING QUEUE ENTRY IN THE JOB EXECUTION TABLE (JXT).

   JSH RELEASES THE JOBS MEMORY AND RELEASES THE JOBS DATASET AND UPDATES THE MEMORY SEGMENT TABLE (MST).

8. THE STATION CALL PROCESSOR (SCP) TASK MANAGES SYSTEM MEMORY BUFFERS AND TRANSMITS THE JOBS OUTPUT DATASETS TO THE FRONT-END VIA THE FRONT-END DRIVER.

9. UPON RECEIPT OF EACH OUTPUT DATASET BY THE FRONT-END, THE STATION CALL PROCESSOR (SCP) REQUESTS THE PERMANENT DATASET MANAGER (PDM) TO DELETE THE DATASET CATALOG (DSC) ENTRY FOR THE DATASET AND DQM RELEASES THE DATASETS DISK SPACE.
