

Insulation coordination

| Parameter | Symbol | Unit | Value | Comment | |
|--|----------------------------------|------|--------------------------|---|--|
| Rms voltage for AC insulation test, 50 Hz, 1 min | U _d | kV | 3.8 | | |
| Impulse withstand voltage 1.2/50 µs | Û _w | kV | 16 | | |
| Insulation resistance | R _{IS} | MΩ | 200 | measured at 500 V DC | |
| Comparative tracking index | СТІ | | 600 | | |
| Application example | | | 1000 V CAT III, PD2 | Reinforced insulation, non uniform field according to EN 50178, IEC 61010 | |
| Application example | | | 1000 V CAT III, PD2 | Basic insulation, non uniform field according to EN 50178, IEC 61010 | |
| Case material | - | - | V0 according to UL 94 | | |
| Clearance and creepage | See dimensions drawing on page 7 | | | | |

Environmental and mechanical characteristics

| Parameter | Symbol | Unit | Min | Тур | Мах | Comment |
|-------------------------------|----------------|------|-----|-----|-----|---------|
| Ambient operating temperature | T _A | °C | -40 | | 85 | |
| Ambient storage temperature | Ts | °C | -50 | | 90 | |
| Mass | т | g | | 503 | | |

Electrical data

At $T_A = 25 \text{ °C}$, $\pm U_C = \pm 24 \text{ V}$, $R_M = 1 \Omega$, unless otherwise noted. Lines with a * in the conditions column apply over the -40 ... 85 °C ambient temperature range.

| Parameter | Symbol | Unit | Min | Тур | Мах | | Conditions | | |
|--|-----------------------|---------------------------|--------------|---|------------|---|--|--|--|
| Primary nominal rms current | I _{PN} | А | | | 1000 | * | | | |
| Primary current, measuring range | I _{PM} | A | -2700 | | 2700 | * | | | |
| Measuring resistance | R _M | Ω | 0 | | | * | Max value of $R_{_{\rm M}}$ is given in figure 1 | | |
| Secondary nominal rms current | $I_{_{\rm SN}}$ | А | -0.2 | | 0.2 | * | | | |
| Resistance of secondary winding | R _s | Ω | | | 29.9 | | $R_{\rm s}(T_{\rm A}) = R_{\rm s} \times (1 + 0.004 \times (T_{\rm A} + \Delta \text{temp-25}))$ Estimated temperature increase @ $I_{\rm PN}$ is $\Delta \text{temp} = 15 ^{\circ}\text{C}$ | | |
| Secondary current | Is | А | -0.54 | | 0.54 | * | | | |
| Number of secondary turns | Ns | | | 5000 | | | | | |
| Theoretical sensitivity | G_{th} | mA/A | | 0.2 | | | | | |
| Supply voltage | ±U _c | V | ±14.25 | | ±25.2 | * | | | |
| Current consumption | I _c | mA | | $\begin{array}{c} 44 + I_{\rm S} \\ 49 + I_{\rm S} \end{array}$ | | | $\begin{array}{l} \pm U_{\rm c} = \pm 15 \text{ V} \\ \pm U_{\rm c} = \pm 24 \text{ V} \end{array}$ | | |
| Offset current, referred to primary | $I_{\rm o}$ | A | -1 | | 1 | | | | |
| Temperature variation of $I_{\rm o}$, referred to primary | $I_{_{ m OT}}$ | A | -0.6 | | 0.6 | * | | | |
| Magnetic offset current, referred to primary | I _{om} | А | | ±1 | | | After 3 × $I_{_{PN}}$ | | |
| Sensitivity error | ٤ _G | % | -0.15 | | 0.15 | * | | | |
| Linearity error | $\epsilon_{_{\rm L}}$ | % of $I_{_{\rm PN}}$ | -0.15 | | 0.15 | * | | | |
| Overall accuracy at $I_{_{\rm PN}}$ | X _G | % of $I_{_{\mathrm{PN}}}$ | -0.2 -0.4 | | 0.2 0.4 | * | 25 … 70 … 85 °C −40 … 85 °C | | |
| Output rms current noise referred to primary | $I_{\rm no}$ | mA | | 50 | | | 1 Hz to 20 kHz (see figure 4) | | |
| Reaction time @ 10 % of $I_{_{\rm PN}}$ | t _{ra} | μs | | < 0.5 | | | 0 to 1 kA, 200 A/µs | | |
| Step response time to 90 % of $I_{_{\rm PN}}$ | t _r | μs | | < 0.5 | | | 0 to 1 kA, 200 A/µs | | |
| Frequency bandwidth | BW | kHz | | 200 | | | −3 dB, small signal bandwidth (see figure 5) | | |

Definition of typical, minimum and maximum values

Minimum and maximum values for specified limiting and safety conditions have to be understood as such as well as values shown in "typical" graphs.

On the other hand, measured values are part of a statistical distribution that can be specified by an interval with upper and lower limits and a probability for measured values to lie within this interval.

Unless otherwise stated (e.g. "100 % tested"), the LEM definition for such intervals designated with "min" and "max" is that the probability for values of samples to lie in this interval is 99.73 %.

For a normal (Gaussian) distribution, this corresponds to an interval between -3 sigma and +3 sigma. If "typical" values are not obviously mean or average values, those values are defined to delimit intervals with a probability of 68.27 %, corresponding to an interval between -sigma and +sigma for a normal distribution.

Typical, minimum and maximum values are determined during the initial characterization of the product.
