Notes: *1. This value can change due to the switching frequency, environmental conditions, and desired reliability level, therefore it is recommended to check this with the actual load.
*2. Response time is the time after the coil voltage turns off until the time when "a" contact turns off.
*3. The upper limit of the ambient temperature is the maximum temperature that can satisfy the coil temperature rise value. Refer to Usage, transport and storage conditions in NOTES
*4. Response time of built-in diode type is 12 ms or less (excluding contact bounce time when nominal coil voltage is applied to the coil).

## Other contact gaps when contacts are welded

Sample: SFS4-DC24V (4 Form A 2 Form B)
The table below shows the state of the other contacts.
In case of form "NO" contact weld the coil applied voltage is 0 V .
In case of form "NC" contact weld the coil applied voltage is nominal.

Empty cells: either ON or OFF
Note: Contact gaps are shown at the initial state.
If the contact transfer is caused by load switching, it is necessary to check the actual loading.
