## Phaseo modular regulated power supply units

### ABL 7RM modular switch mode power supply units

The ABL 7RM range of power supply units is designed to provide the d.c. voltage necessary for the control circuits of automation system equipment. Comprising 2 products, this range meets all the needs encountered in industrial, commercial and residential applications. These single-phase, modular, electronic switch mode power supply units provide a quality of output current with is suitable for the loads supplied and compatible with the Zelio logic range, making them ideal partners. Clear guidelines are given on selecting the upstream protection devices which are often used with them, and thus a comprehensive solution is provided which can be used in total safety.

Switch mode power supply units are totally electronic and regulated. The use of electronics makes it possible to significantly improve the performance of these power supplies, which offer:

- compact size,
- integrated overload, short-circuit, overvoltage and undervoltage protection,
- a very wide range of permitted input voltages, without any adjustment,
- a high degree of output voltage stability,
- good performance,
- considerably reduced weight,
- a modular format allowing incorporation into control panels.

Phaseo power supply units are single-phase. They deliver a voltage which is precise to 3%, whatever the load and whatever the type of mains supply, within a range of 85 to 264 V for single-phase voltage. Conforming to IEC standards and UL and CSA approved, they are suitable for universal use. The inclusion of overload and short-circuit protection makes downstream protection unnecessary if discrimination is not required.

The products are also equipped with an output voltage adjustment potentiometer in order to be able to compensate for any line voltage drops in installations with long cable runs.

These power supply units are designed for direct mounting on 35 mm and 75 mm rails, or on a mounting plate by means of retractable fixing lugs.

These power supply units are single-phase and two references are available :

- ABL 7RM2401 (24 V $\pm$ 1.3 A).
- ABL 7RM1202 (12 V $\pm$ 1.9 A) .

### Description

- 1 2.5 mm<sup>2</sup> screw terminal for connection of the incoming a.c. supply voltage.
- 2 Output voltage adjustment potentiometer.
- 3 2.5 mm<sup>2</sup> screw terminal for connection of the output voltage.
- 4 LED indicating presence of the d.c. output voltage.
- 5 Retractable fixing lugs.

	Mains interference		EN 61000-4-11	

### Output characteristics

#### Derating

The ambient temperature is a determining factor which limits the power that an electronic power supply unit can deliver continuously. If the temperature around the electronic components is too high, their life will be significantly reduced. Conversely, a power supply unit can deliver more than its rated power if the ambient temperature remains well below the nominal operating temperature.

The maximum ambient temperature for Phaseo power supply units is 55°C. Below this temperature, derating is possible up to 110% of the nominal power. The graph below shows the power (in relation to the nominal power) which the power supply unit can deliver continuously, according to the ambient temperature.

## Safety and isolation transformers (25 to 2500 VA)

### Presentation

---

### Presentation

---

The ABL-6T range of single phase transformers is designed to supply the control circuits of electrical equipment from a 230 or 400 V supply at 50 or 60 Hz. Additional +15V and -15V connectors can provide better adaptation to the local network if necessary.

ABL-6T transformers ensure electrical isolation between the supply and application. The entire range is fitted with an earth screen in order to reduce the spreading of electromagnetic interference and increase user safety. ABL-6T transformers are protection class I and are supplied with no housing, degree of protection IP 20.

They conform to EN 60 742, IEC 742 standards and are UL approved.  
They are manufactured to insulation classification B or F depending on the product.  
The windings are vacuum impregnated with solvent free resin.  
The maximum operating temperature is 60 °C without derating.

---

### Connections

---

The product range makes it possible to cover a power range from 25 to 2500 VA.

All products have a 230/400 V +/- 15V dual voltage primary and are available in standard versions with voltages for 12, 24, 48, 115 and 230 V control circuits.  
ABL-6T transformers are available as a single secondary winding version (12, 24, 115 and 230 V) and a double secondary winding version (2 x 24 or 2 x 115 V) to enable series (to obtain 48 or 230 V) or parallel connections.

---

### Protection

---

The transformers can be protected against short-circuits using fuses or thermal magnetic circuit-breakers mounted on the secondary winding.

To operate according to UL standards, short-circuit protection must be achieved using fuses (with UL approval) on the primary.

Where the control circuit is isolated from the earth (IT scheme), a earth leakage detector will indicate any accidental isolation fault (see "Measurement and control relays" catalogue n° 29709).

## Safety and isolation transformers (25 to 2500 VA)

### Selection

### Selection

ABL-6T transformers are characterised by the apparent nominal power which they can supply continuously. But they are also designed to supply, when necessary, much higher powers, such as contactor inrush peaks.

Contactor inrush peaks can reach 10 to 20 times the required holding current. This leads to the transformer being oversized in relation to the continuous power it is to supply. The transformer must be sized so that the voltage drop at its terminals, caused by the inrush, remains within the permissible limits for the contactor to close properly.

The two power values which need to be taken into account to determine which transformer rating to use are thus  
- the continuous power which the transformer is to supply  
- and the maximum inrush current which it must provide.

In practice, only the sum of the holding currents and the largest contactor inrush current need to be considered.

For Telemecanique transformers, the graph below can be used to select the rating to use according to these two currents. This ensures a maximum voltage drop of 5 % at the moment of the inrush, compatible with correct operation of the entire installation. However, these transformers have been designed for continuous operation at nominal load and at an ambient temperature of 60 °C. A reduction in the ambient temperature may uprate the transformer which, in some cases, enables a lower rating to be used.

The graph below has therefore been drawn for 40 and 60 °C.

The inrush values of the contactor coils are given in the contactor control circuit characteristics pages.

Example : A device with a total holding current of 200 VA and inrush current of the largest contactor of 700 VA, can be supplied by a 630 VA transformer if it is used at an ambient temperature of 60 °C. A 400 VA transformer is sufficient if the ambient temperature is 40 °C.

## Power supplies for d.c. control circuits

### Presentation

#### ABL-●R power supplies

The ABL-●R range of power supplies is designed to provide the d.c. voltage necessary for the control circuits of most control system equipment. Split into five families, this range meets all the needs encountered in industrial, commercial and residential applications. Whether they are single-phase or 3-phase, electronic switch mode or conventional type with rectifier, they provide a quality of output current which is suitable for the loads supplied and compatible with the mains supply available in the equipment. Clear guidelines are given on selecting protection devices which are often used with them, and thus a comprehensive solution is provided which can be used in total safety.

#### Phaseo switch mode supplies

Switch mode power supplies are totally electronic and regulated. The use of electronics makes it possible to significantly improve the performance of these power supplies, which offer:

- compact size,
- integrated overload, short-circuit, overvoltage and undervoltage protection,
- a very wide range of permitted input voltages, without any adjustment,
- a high degree of output voltage stability,
- good performance,
- considerably reduced weight.

Phaseo power supplies are available in single-phase and 3-phase versions. They supply a voltage which is precise to 3%, whatever the load and whatever the type of mains supply, within a range of 85 to 364 V for single-phase, or 360 to 550 V for 3-phase. Conforming to IEC standards and UL and CSA approved, they are suitable for universal use. The inclusion of overload and short-circuit protection makes downstream protection unnecessary if discrimination is not required.

The products are also equipped with an output undervoltage control which causes the product to trip if the output voltage drops below 19 V, in order to ensure that the voltage supplied is always usable by the actuators being supplied. All the products are fitted with an output voltage adjustment potentiometer (in the range 24 to 28.8 V) in order to be able to compensate for any line voltage drops in installations with long cable runs. These power supplies are designed for direct mounting on 35 mm and 75 mm  $\text{U}_T$  rails.

These power supplies are available in single-phase and 3-phase versions and are split into three families:

- The ABL-7RE family includes products that are excellent for typically industrial applications. They are extremely compact and very easy to install, as well as being attractively priced.
- The ABL-7RP family of products is more general-purpose. These supplies are fitted with an input filter (PFC) which enables them to be used in commercial and residential environments (conforming to standard IEC 1000-3-2). In addition, they offer two operating modes for dealing with overloads and short-circuits:
  - "AUTO" mode which ensures automatic restarting of the supply as soon as the fault is cleared;
  - "MANU" mode which requires the supply to be reset before restarting is possible. Resetting is achieved by switching off the mains supply (on the product).
- The ABL-7RU family, for use on 3-phase mains supplies, is designed for applications that include high consumption loads. They can supply up to 960 W, in both industrial and commercial environments.

#### Filtered rectified power supplies

Filtered rectified power supplies are built using a safety transformer fitted with a bridge rectifier and filter capacitors. With no regulation system, of simple and rugged construction, their output voltage will withstand mains voltage variations and load variations while remaining within the range defined in standards IEC 1131-2. They are particularly suitable for applications with high current inrush.

These supplies are split into two families:

- The single-phase filtered rectified ABL-6RF family is suitable for connection to European 230/400 V and American 120/240 V single-phase supplies. An optional mounting plate for mounting on a  $\text{U}_T$  rail, simplifies their installation.
- The 3-phase filtered rectified ABL-6RT family is particularly suitable where a high power level is required for actuators and preactuators. In particular, for "All --- 24 V" equipment, or for controlling d.c. valves and solenoid valves.

## Power supplies for d.c. control circuits

### Presentation

#### Using $\approx$ 24 V

- Using  $\approx$  24 V enables so-called protection installations (PELV) to be built. Using PELV is a measure designed to protect people from direct and indirect contact. Measures relating to these installations are defined in publication NFC 12-201 and in standard IEC 364-4-41.
- The application of these measures to the electrical equipment in machines is defined in standard NF EN 60204-1 and requires :
  - that the voltage used is below 60 V d.c. in dry environments and below 30 V in damp environments.
  - the connection of one side of the PELV circuit, or one point of the source, to the equipotential protection circuit associated with higher voltages.
  - the usage of switchgear and control gear on which measures have been taken to ensure "safety separation" between power circuits and control circuits.
- A safety separation is necessary between power circuits and control circuits in PELV circuits. Its aim is to warn of the appearance of dangerous voltages in  $\approx$  24 V safety circuits.
- The reference standards involved are :
  - IEC 742, EN 60742, DIN/VDE 0551 T1 (safety transformers).
  - IEC 664 (coordination of isolation).Telemecanique power supplies meet these requirements.
- Moreover, to ensure that these products will operate correctly in relation to the demands of the reinforced isolation, it is recommended that the products be mounted and wired as indicated below :
  - they should be placed on an earthed mounting plate or rail,
  - they should be connected using flexible cables, with a maximum of two wires per connection, and tightening to nominal torque,
  - conductors of the correct insulation class must be used.
- If the d.c. circuit is not connected to an equipotential protection conductor, an earth leakage detector will indicate any accidental insulation faults (see catalogue "Measurement and control relays" n° 29709).

#### Operating voltage

- The acceptable tolerances for the operating voltage are listed in publications IEC 1131-2 and DIN 19240.
  - For nominal voltage  $U_n = \approx$  24 V, the extreme operating values are from - 15 % to + 20 % of  $U_n$ , whatever the supply variations may be in the range - 10 % to + 6 % (defined by standard IEC 38) and load variations in the range  $I_n$  0-100%.  
  
Consequently the values are as follows :
    - maximum voltage (peak) : 30 V
    - nominal voltage : 24 V
    - minimum voltage (peak) : 19.2 V
- All Telemecanique  $\approx$  24 V supplies have been designed to provide a voltage within this range.
- It may be necessary to use a voltage measurement relay to detect when the normal voltage limits are being surpassed and to deal with the consequences of this (see catalogue n° 29709).

## Power supplies for d.c. control circuits

### Selection

#### Selection of power supplies

The characteristics to be taken into account when selecting a power supply are :

- the required output voltage and current,
- the mains voltage available in the installation.

An initial selection can be made using the table below.

This may however result in several products being selected as suitable.

Other selection criteria must therefore be taken into account.

#### ● The quality of the mains power supply

Filtered rectified power supplies provide a non-regulated voltage, sensitive to load and mains power supply fluctuations. They can only be used where a good quality mains supply is available, with fluctuations limited to -10%...+10% of the nominal value.

Graphs showing the output voltage as a function of the rated current of the load and the input voltage for ABL-6RF and ABL-6RT supplies are given on page 14054/5.

If the quality of the mains supply is not suitable for a rectified power supply, a regulated supply must be used.

The Phaseo range is the solution because it guarantees precision to 3% on the output voltage, whatever the load current and the input voltage. In addition, the wide input voltage range of Phaseo power supplies allows them to be connected to all mains supplies within the nominal range, without any adjustment.

The Phaseo RP family can also be connected to  $\approx$  110 and 220 V emergency supplies.

#### ● Harmonic pollution (power factor)

The current drawn by a power supply is not sinusoidal. This leads to the existence of harmonic currents which pollute the mains supply. European standard EN 61000-3-2 limits the harmonic currents produced by power supplies. This standard covers all devices of more than 75 W, drawing up to 16 A per phase, and connected directly to the public mains power supply. Devices connected downstream of a private, low voltage, general transformer are therefore excluded.

By design, rectified power supplies produce very little harmonic current and can therefore be used on the public mains supply. However, switch mode supplies produce much more harmonic current and a filter circuit (Power Factor Correction or PFC) must therefore be added to comply with standard EN 61000-3-2.

Power supplies ABL-6RF, ABL-6RT and Phaseo ABL-7RP and ABL-7RU conform to standard EN 61000-3-2 and can therefore be connected directly to public mains power supplies.

#### ● Behaviour in the event of short-circuits

In the event of an overload or short-circuit, rectified power supplies must be protected by an upstream fuse or circuit breaker to prevent their destruction. Models ABL-6RF2401, ABL-6RF2402 and ABL-6RF2405 are fitted, as standard, with a 5 mm x 20 mm glass fuse.

Phaseo power supplies, on the other hand, are fitted with electronic protection. This protection automatically resets as soon as the fault is cleared, so avoiding the need to take action or replace a fuse. In addition, with the Phaseo RP range, the user can select the reset method in the event of a fault:

- in the "AUTO" position, resetting is automatic,
- in the "MANU" position, resetting will take place after the fault has been cleared and after the mains power has been switched off and back on (on the power supply). This feature means that Phaseo RP can be used in installations where the risks associated with sudden restarting are high.

## Output characteristics

### Derating

The ambient temperature is a determining factor which limits the power that an electronic power supply can deliver continuously. A temperature which is too high around the electronic components significantly reduces their life. However, if the ambient temperature remains largely below the rated operating temperature, then a power supply can deliver more than its nominal power.

The rated ambient temperature for Phaseo power supplies is 50°C. Below this, an increase in rating is possible up to 120% of the nominal power. Above 50°C, a derating is necessary up to a maximum temperature of 60°C.

The graph below shows the power (in relation to the nominal power) which the power supply unit can deliver continuously, according to the ambient temperature.

Derating should be considered in the following extreme operating conditions:

- intensive operation (output current permanently close to the nominal current, combined with a high ambient temperature),
- output voltage set above 24V (to compensate for line voltage drops, for example),
- parallel connection to increase the total power.

	Phaseo RE	Phaseo RP	Phaseo RU
Intensive operation	Without derating, from 0°C to 50°C Derating of nominal current by 1% per additional °C up to 60°C		Without derating, from 0°C to 60°C
Rise in output voltage	The nominal power is fixed. Increasing the output voltage means that the current delivered must be reduced.		
Parallel connection to increase the power	The total power is equal to the sum of the powers of the power supplies used, but the maximum ambient temperature for operation is 50°C. To improve heat dissipation, the power supplies must not be in contact with each other.		

In all cases, there must be adequate convection round the products to ensure easier cooling; There must be a clear space of 50 mm above and below Phaseo power supplies and of 15 mm at the sides.

## Power supplies for d.c. control circuits Rectified power supplies

### Output characteristics

#### Example using the graph

For an ABL-6RF2405 power supply used with a variable load of 1 to 5 A on a mains supply with  $U_n \pm 10\%$ , the graph shows the limits at the load terminals : 21 and 30 V.  
 Note : permitted loads are represented vertically as images of the rated load current at rated voltage.

- 1 Rated supply +10%
- 2 Rated supply
- 3 Rated supply -10%
