## General

Baumüller **GN....N** DC motors are manufactured in IEC axle heights of between 100 and 280.

### Structure

The motors are fully laminated and have four poles. They are uncompensated and insulation is of class H. On request, we can also produce axle heights of 180 – 280 compensated too.

As standard, **GNA .N** DC motors are designed with mounted radial forced ventilation of IP23 type of protection.

**GN ... .N**

Version EN60034	IM B3 IM B5 IM B35 IM V1 IM V3	horizontal mounting for size 100-280 horizontal mounting for size 100-160 horizontal mounting for size 100-280 vertical mounting, shaft end to the bottom vertical mounting, shaft end to the top
Type of protection	IP23	internally cooled, <b>with</b> fan (IP20 for version V)EN60034-5
Connection: Main connection		Terminal box
Control connection		Tachometer conn. (option pulse encoder, 12-pin connector)
Brake		inside terminal box
Thermal sensor		inside terminal box
Type of cooling	IC 06	internally cooled machine with fan
Thermal sensor		2 thermal relays
Temperature rise		$\Delta\theta = 125 \text{ K}$ insulation class H acc. to EN 60034
Temperature range	0....+ 40° C, -30° C...+85° C	
Storage		RAL 7001, 9005, 6011, 7015, 7032 (primed)
Paint		Service life
Bearings	$\geq 20,000 \text{ h}$	acc. to DIN EN 60034 -14
Balance quality	N	On request
Vibration-resistant up to	3g	Higher vibration-resistance on request
Flange		acc. to IEC standard 42948. Axial or radial tolerance acc. to DIN 42955N option R
Shaft end	cylindrical	acc. to DIN 748 with keyway DIN 6885; centring with internal thread acc. to DIN 332 form D (also available without keyway); Dim. d:Tolerance (without keyway h6)
Holding brake	Optional	
Actual speed encoder	DC Tacho	Incremental encoder (optional) Other encoders on request

## Performance Definition

The power output stated in the list applies to continuous running duty (S1) at nominal speed, at a maximum ambient temperature of 40° C and at a site altitude of less than 1000 m above sea level. The armature circuit is fed with direct current whose harmonic content does not exceed 25%.

You must operate the motor close to the nominal working point. Running the motor for a relatively long period of time and reaching less than 60% of the nominal power results in underload operation. You must ask the manufacturer to take special measures for this, otherwise the full warranty cannot be granted.

If motors are to be operated at an ambient temperature of more than 40° C or at site altitudes of more than 1000 m above sea level, the required list power  $P_L$  is the product of factors  $k_1$  or  $k_2$  and the required power  $P$ .

Ambient temperature	40° C	45° C	50° C	55° C	60° C
Correction factor $k_1$ approximately	1	1.06	1.13	1.22	1.34
Altitude above sea level up to	1000 m	2000 m	3000 m	4000 m	5000 m
Correction factor $k_2$ approximately	1	1.07	1.16	1.27	1.55

At ambient temperatures above 40° C and with motors of enclosed design, contact the manufacturer for any design modifications that may be required

In the case of sites above 1000 m where the ambient temperature drops by approx. 10° C per 1000 m, power correction is not necessary.

## Operating Modes

Please inquire at the factory about motors for intermediate periodic loading (S 3), continuous duty with intermittent loading (S 6), short-time duty (S 2) and about motors for switching operation (S 4, S 5, S 7). If necessary, please quote operating and break times, torques, transformation ratios etc. inquire at the factory. You can roughly calculate as shown below the necessary list power,  $P_L$  from the product of  $k_4$  and the required power output  $P$  for operating modes S 2, S 3 and S 6:

Intermediate periodic loading S 3 with ED With internally cooled machines	15%	25%	40%	60%
	0.6	0.7	0.8	0.9
Continuous duty with intermittent loading S 6 with ED With internally cooled machines factor $k_4$	15%	25%	40%	60%
	0.6	0.6	0.65	0.8
Short-time duty S 2 with ED With internally cooled machines factor $k_4$	10 min	30 min	60 min	90 min
	0.6	0.73	0.9	0.96

## Winding Insulation and Heating

All the machines of this series are designed to comply with insulation material class H according to EN 60034 for a permissible winding overtemperature of 125 K at an ambient temperature of up to 40° C. The insulation is resistant to the gases and vapours of flammable materials and meets the requirements that are made of materials that are damp-resistant and suitable for tropical conditions.

Special insulation is available at an extra charge, which is necessary in conditions in which there is concentrated acid vapour or metal dust or where the relative humidity is permanently above 80%. The insulation is also needed to provide protection from termites and mould.

When placing your order, you must state the following operating and ambient conditions:

- **Light load less than 60% of nominal load, for a relatively long period**
- **Temperature of cooling air less than 10° C**
- **Relative humidity less than 10% or greater than 80%**
- **If gases and vapours occur, such as chlorine, hydrogen sulphide, silicone or oil, for example, you must state the type and concentration.**

## Overload capacity

In accordance with EN 60034, the motors have a 1.5-fold current overload capacity for 45 seconds at the rated voltage and the rated excitation (note the reduced values with field weakening operation).

Motors for higher or longer peak loads or reduced motor moments of inertia are available on request.

**Controlled speed reduction**

You reduce the RPM speed by reducing the armature voltage.

The DC motors in this catalogue have a constant torque of up to 50 RPM downwards in the armature control range.

**Controlled speed increase**

Increasing the RPM speed is carried out by means of field weakening without losses starting from the basic RPM speed. In this connection, you can retain the list power for the basic RPM speed across the field weakening range assuming that the increase in the RPM speed does not exceed the value  $n_{\max \text{ elektrisch}}$ , which is stated in the list.

In the case of short-time duty or intermediate periodic loading, it is permissible to increase the power above the list power.

In field weakening operation, there is a limited overload capacity.

Field weakening above  $n_{\max \text{ electrical}}$  is possible in many cases; however, it always results in a reduction in power.

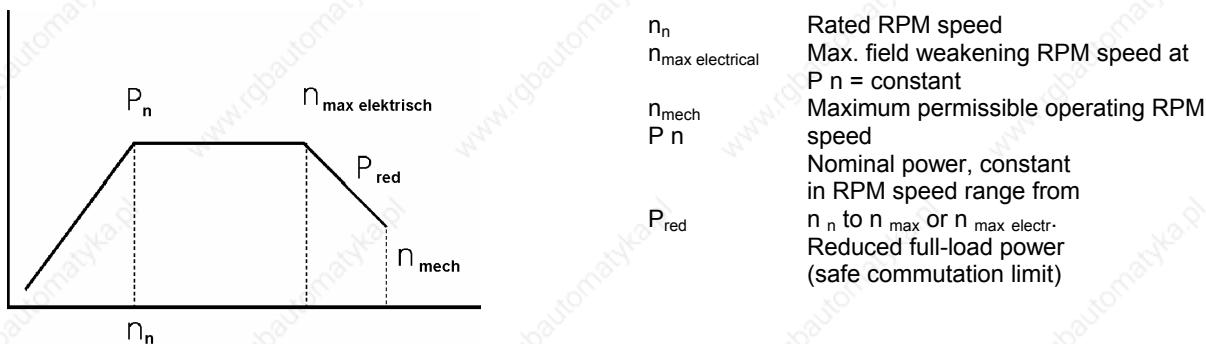

In the case of extreme field control ranges, you must provide a compensating winding to limit the armature reaction.

**Excitation**

The exciter power losses in the list refer to separately excited machines without a stabilizing series winding.

In the case of switch off on the DC side, a free-wheeling diode or a parallel resistor must protect the field winding from closing overvoltages.

By preference, you should use the standard voltage of 310 V as the field voltage. In this case too it is possible to use different voltages; in particular, the 340 V output voltage that can be obtained from the bridge circuit with a 400-V feed.

**Stabilizing series winding**

A stabilizing series winding can be fitted on request to stabilize the RPM speed.

All motors that are intended for tachometer control, as well as compensated motors are executed without a stabilizing series winding.

**Compensating winding**

For special requirements, e.g. impulse load operation, reversing operation and with a large field weakening range, it is possible to execute motors from size 180 onwards with a compensating winding.

Changes in RPM speed and output with a compensating winding:

Size	Speed	Reduction factor Torque	Output
180 to 280	0.94	0.93	0.874

## Type Selection

Converting list values to the desired RPM speed:

Normally, you start from the next highest RPM speed. You set the desired – lower – RPM speed by reducing the armature voltage on the armature voltage regulator. The torque remains constant with the output reducing with the RPM speed.

Starting from the next lowest RPM speed, you can set the desired – higher – RPM speed at constant output by field weakening (reducing the exciter current). This is an option with the field supply.

## Preferred Types

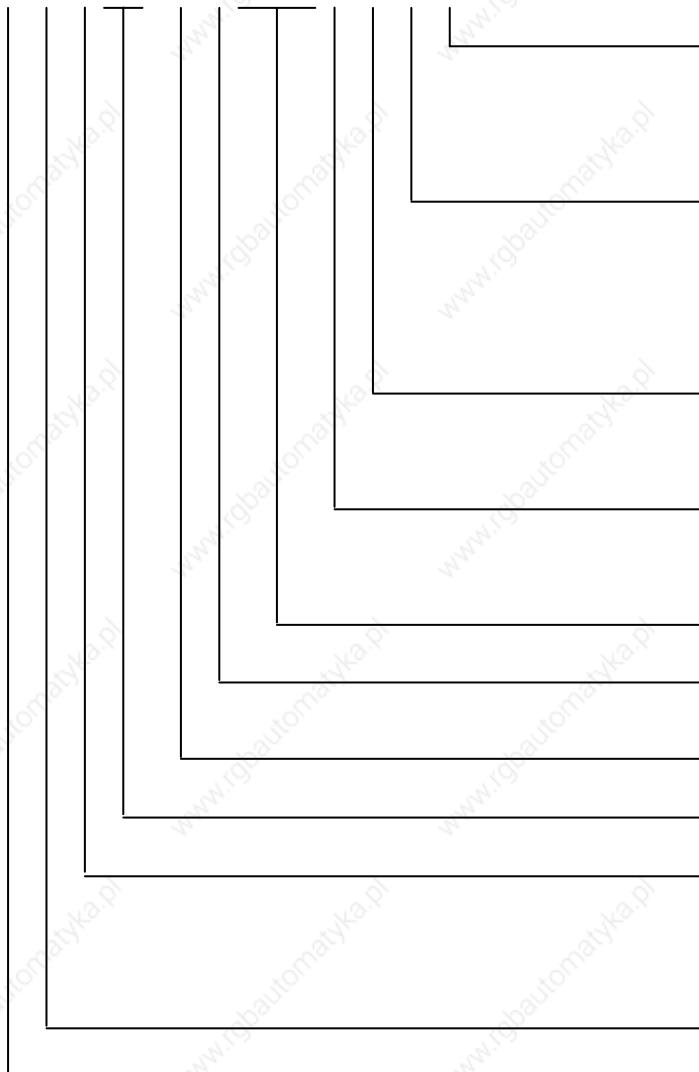

The motor types that are shown in the technical data with a grey background are preferred types.

The technical design of the preferred types is as follows:

- Fan at top, on B side, fan screw to right
- Rectangular filter to B side
- KLK on right, on B side, PGs according to dimensional drawing
- Tachometer generator GHT S 42 with 20V/1000 RPM
- Structural form IM B3
- Type of protection IP 23
- Ball bearings
- 2 thermal protectors (one in commutating pole and one in field for switch off)
- Insulation material class H
- Exciter voltage 310 V
- Paintwork RAL 7001, 9005, 6011, 7015 or primed (7032)

## Bearings and Shaft Loading

All machines have rolling-contact bearings. Normally, the floating bearing is on the drive side and the locating bearing is on the non-drive side. Machines with roller bearings on the drive side are only available for increased radial force. When placing your order, please state the radial forces.

### Bearing Assignment of Ball Bearings for A Side

Size	A side	B side
100	6208 2ZR C3	6306 2ZR C3
112	6210 2ZR C3	6209 2ZR C3
132	6212 2ZR C3	6211 2ZR C3
160	6214 2ZR C3	6212 2ZR C3
180	6213 C3	6310 2RSR C3
200	6314 C3	6310 2RSR C3
225	6316 C3	6311 2RSR C3
250	6219 C3	6313 ZR C3
280	6220 C3	6316 C3

### Bearing Assign. of Roller Bearings for A Side

Size	A side	B side
100	NU 208 E	6306 2ZR C3
112	NU 210 E	6209 2ZR C3
132	NU 212 E	6211 2ZR C3
160	NU 214 E	6212 2ZR C3
180	NU 2213 E	6310 2RSR C3
200	NU 314 E	6310 2RSR C3
225	NU 316 E	6311 2RSR C3
250	NU 2219 E	6313 ZR C3
280	NU 2220 E	6316 C3

### Relubrication Intervals

Sizes 100-200 - permanently lubricated

Sizes 225-250 - regreasing device with grease regulation on the A side

Size 280- regreasing device with grease regulation on the A and B sides

### Lubrication intervals (operating hours)

Size	Speed [RPM]				
	1000	1500	2000	2500	3000
225, A-S	7500	4500	3000	2000	1500
250, A-S	6500	4000	2500	2000	1500
280, A-S B-S	6500	3500	2000	1500	-----

In the case of versions with ball bearings on the drive side, lubrication intervals can increase by one-and-a-half times. The lubrication intervals are based on bearing manufacturer data for normal operating conditions. Use only lithium base-saponified special rolling-contact bearing grease for initial or regreasing.

### Determining the radial forces $F_R$

When using belt pulleys, the radial load is calculated according to the following formula:

$P$  = nominal power in kW

$$F_R = k \frac{2 \cdot 10^7 \cdot P}{n \cdot D} \text{ [N]} \quad n = \text{rated RPM speed in RPM}$$

$D$  = disk diameter in mm

By approximation, the belt tension factor,  $k$ , is as follows:

$k = 1.8 \dots 2.5$  for V-belts

$k = 2.2 \dots 3.5$  for flat belts

(Observe the information provided by the belt manufacturer!)

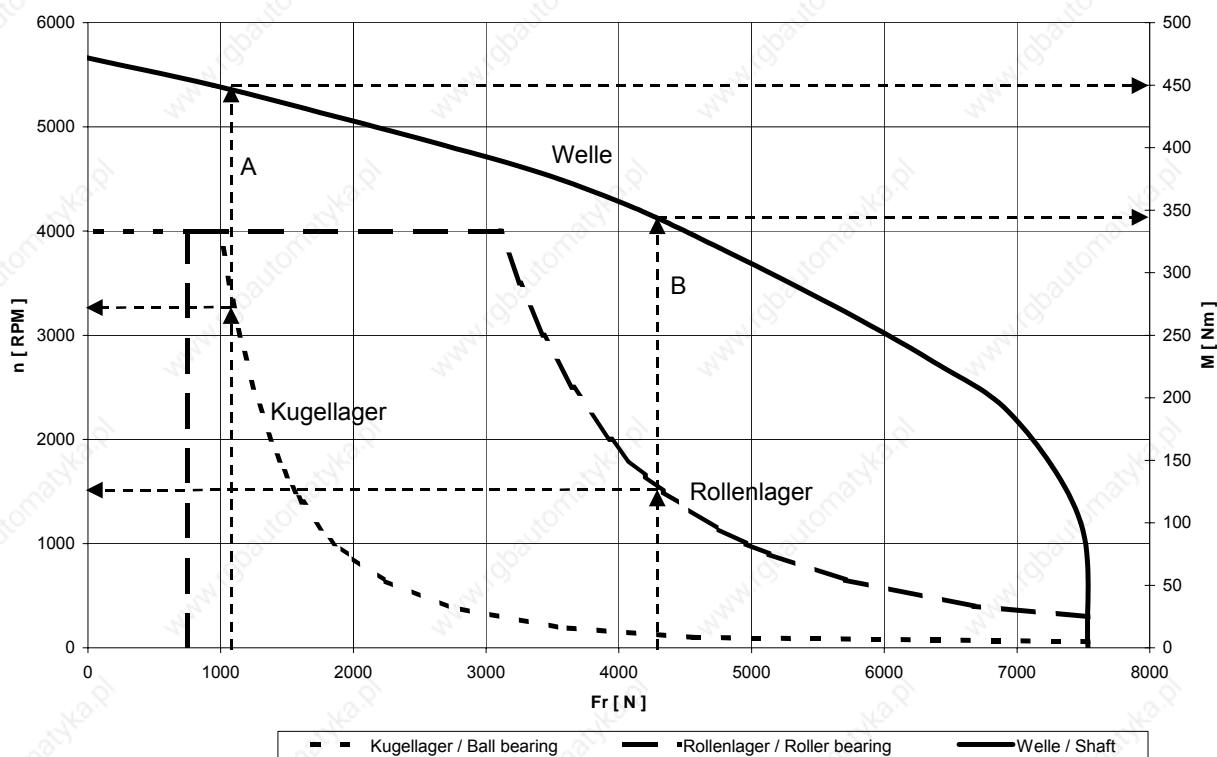

To ensure safe transmission of the torque, it is necessary to exploit the feather key's entire bearing length. Ignoring this can lead to the risk of too high a level of compressive load per unit area on the feather key, which can result in a motor defect. Apart from this, when mounting drive elements (e.g. belt pulleys) you must always push them all the way to the shaft collar on the shaft end. Ignoring this can lead to the risk of the shaft breaking!

### Permissible Radial Forces $F_R$ at the Shaft End

All the bearings have rated service lives of approximately 20,000 operating hours. In this connection, you must not exceed the loading values stated below. The stated permissible radial forces  $F_R$  apply only to motors that are installed horizontally without additional axial forces. If axial forces occur, you must consult the manufacturer.

## Radial Force Diagrams

Sample diagram

### Explanation to the sample diagram

Force applied to end of shaft end (in case of force applied to middle of shaft end  $Fr \times 1.1$ )  
bearing life 20,000 h; shaft end with feather key groove

#### Case A – ball bearings:

Using the application's radial force, Fr, you can determine in the ball bearing characteristic curve the bearing's maximum RPM speed.

Radial force 1100 N => maximum RPM speed 3250 RPM

The maximum torque that can still be transmitted results from the shaft characteristic curve.

Radial force 1100 N => torque that can still be transmitted 450 Nm

#### Case B – roller bearings:

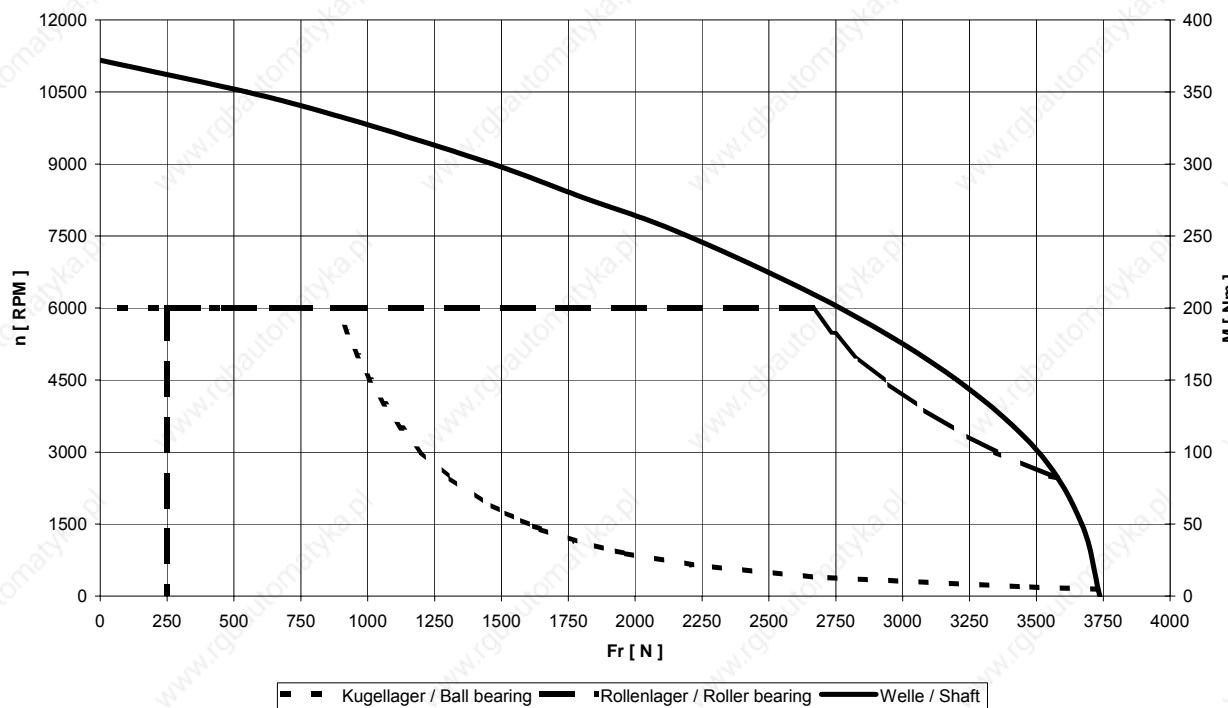

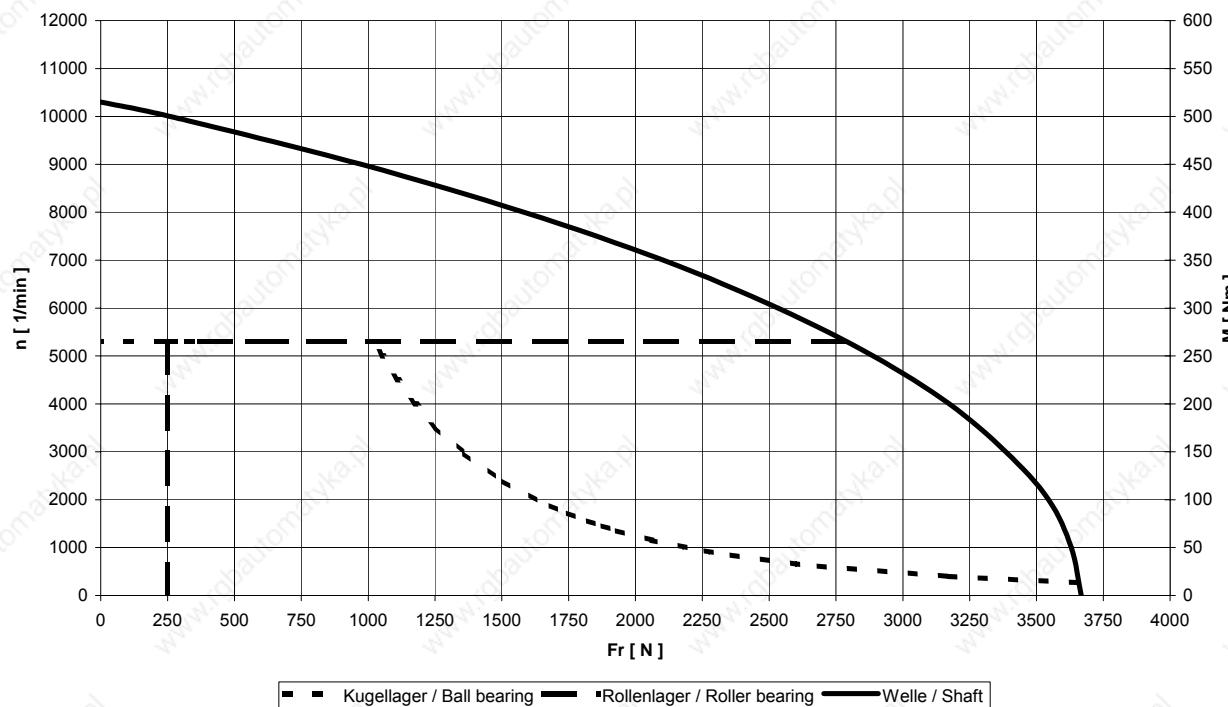

Using the application's radial force, Fr, you can determine in the roller bearing characteristic curve the bearing's maximum RPM speed.

Radial force 4300 N => maximum RPM speed 1500 RPM

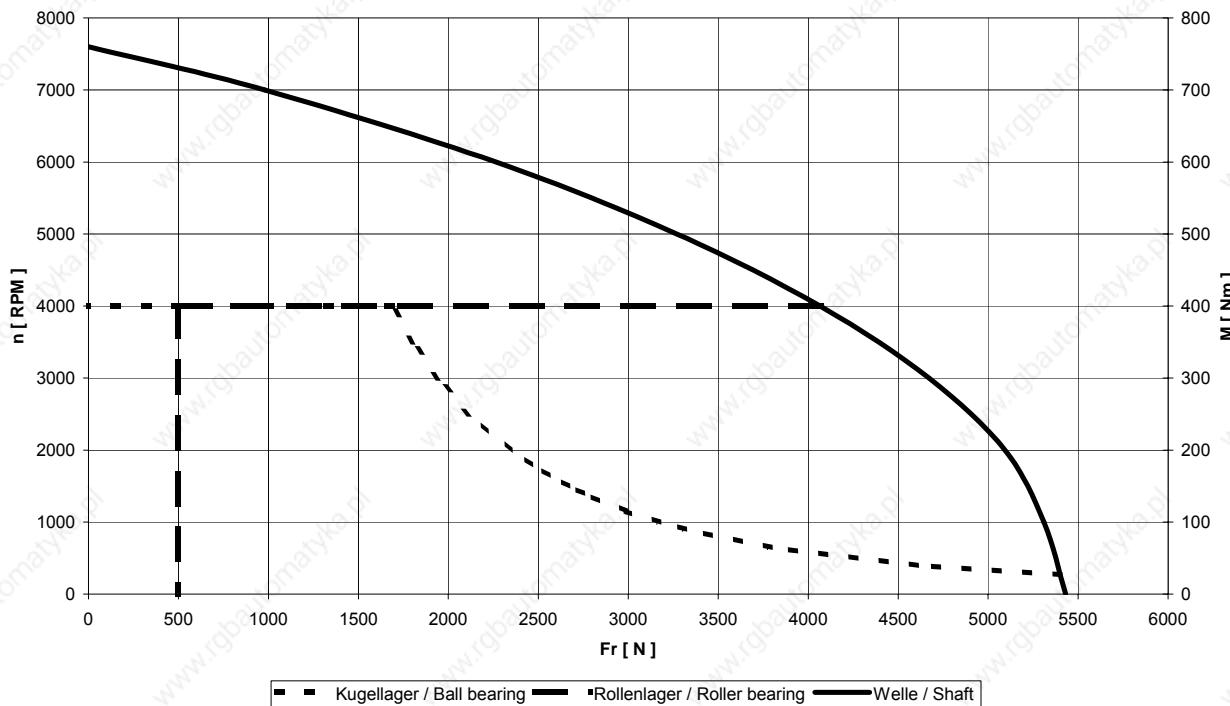

The maximum torque that can still be transmitted results from the shaft characteristic curve.

Radial force 4300 N => torque that can still be transmitted 345 Nm

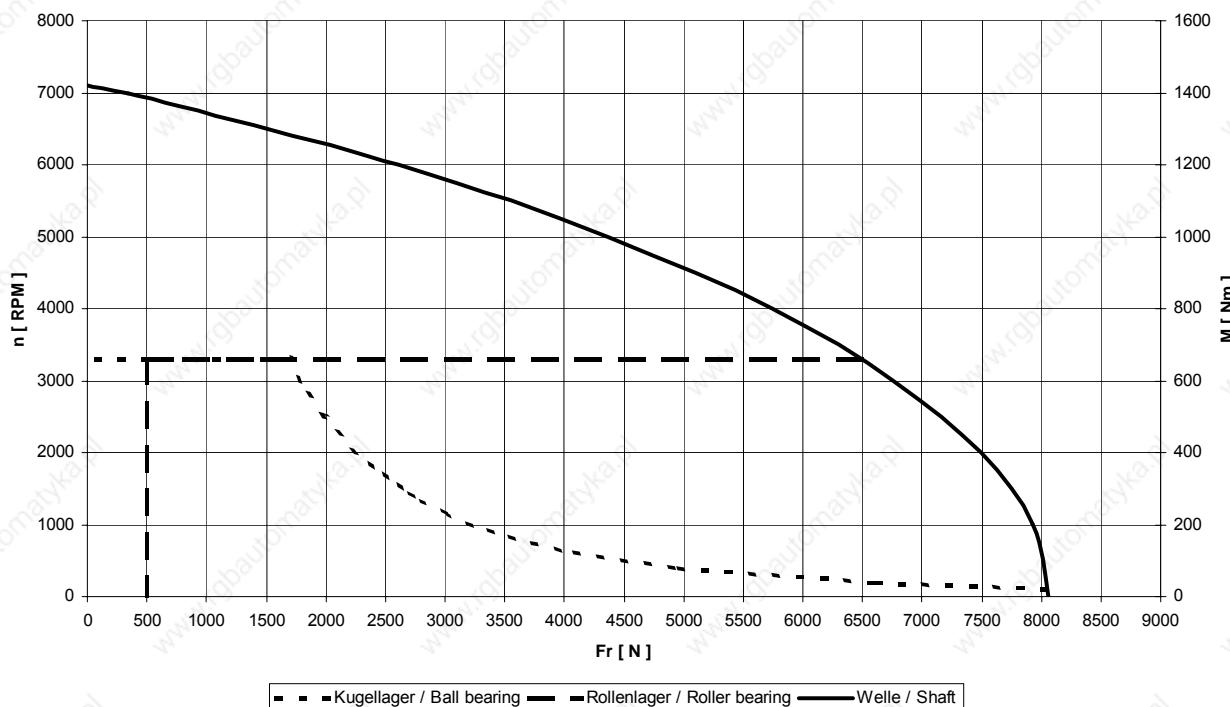

The roller bearing needs a minimum radial force of 800 N to ensure this bearing service life.

GN. 280 .N

**Connection - Terminal Designation**

DC machines	Machine winding of type of winding or conductor in DC supply network	Connection designations according to DIN VDE 0530, Part 8, adapted to IEC 34-8
	Armature winding	A 1 - A 2
	Commutating winding	B1 - B2
	Symmetrically divided	1B1 - 1B2 2B1 - 2B2
	Commutating pole winding with compensating winding	C 1 - C 2
	Symmetrically divided	1C1 - 1C2 2C1 - 2C2
	Series field winding	D1 - D2
	Series field winding - same winding sections on both sides of the armature	1D1 - 1D2 2D1 - 2D2
	Shunt field winding	E1 - E2
	Field winding (separately excited)	F1 - F2
DC supply network	Positive conductor	L+
	Negative conductor	L -
	Middle conductor	M

## Temperature Monitoring

### Thermal protectors

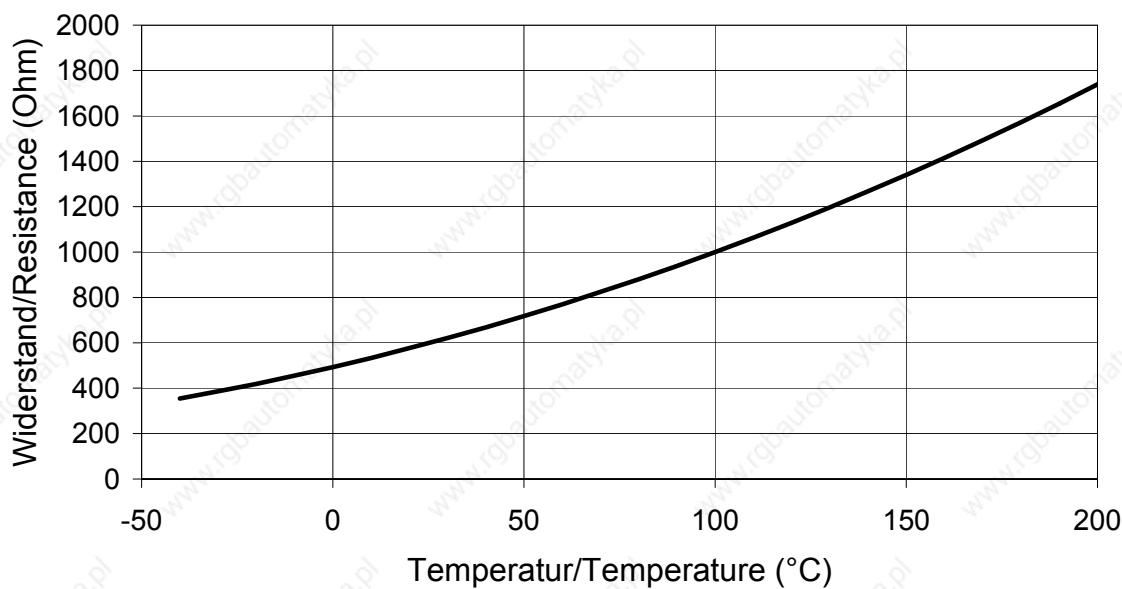

As standard, motors are fitted with two thermal protectors for temperature monitoring one of which is in the commutating pole and the other in the field winding for switching off. On request, it is also possible to use PTC thermistors, KTY 84 temperature sensors or Pt100 measuring shunts. You can also use further temperature monitoring facilities, e.g. for alerts.

AC cos φ 1.0 250V 2.5A; 500V 0.75A; AC cos φ 0.6 250V 1.6A; 500V 0.5A; DC 24V 1.6A

The contacts are implemented as NC contacts.

### Temperature detector (option)

KTY84 - 130

The KTY 84-130 temperature detector continuously monitors the motor temperature  
Feeding a measuring current of 2 mA to the detector yields the resistance curve shown above.

## Brush monitoring

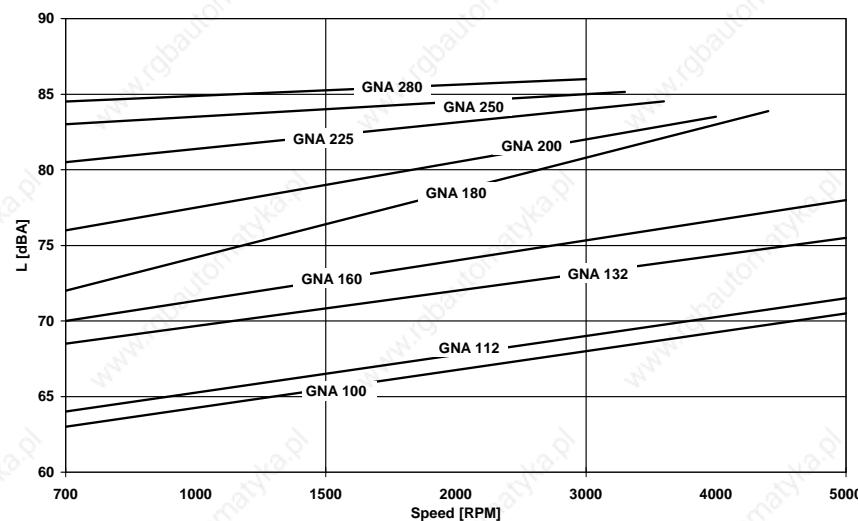

With the motors, you can optionally install potential-free microswitches to monitor the remaining length of the carbon brushes.  
Switching capacity of the microswitches:

Resistive load: 28 V DC - 7 A or 220 V AC - 3 A; Inductive load: 28 V DC - 4 A or 220 V AC - 2 A

Important: Operating voltage at least 12 -28 V, minimum current per contact of 15 mA;

The contacts open when the carbons are worn down.

## Noise level (For internally cooled motors)

The internally ventilated motors do not exceed the limit values stipulated in EN 60034 -9  
A sound absorber reduces the noise level by 3 dBA.

## Vibration severity

Vibration class DIN EN 60034 -14	Speed [RPM]	Size		
		100-132 $V_{eff}$ [mm/s]	160-225 $V_{eff}$ [mm/s]	250-280 $V_{eff}$ [mm/s]
N (Normal)	600 - 1800	1.8	2.8	4.5
	1800 - 3600	1.8	2.8	4.5
	3600 - 6000	2.8	4.5	-
	6000 - 7500	4.5	-	-
R* (Reduced)	600 - 1800	0.71	1.12	1.8
	1800 - 3600	1.12	1.8	2.8
	3600 - 6000	1.8	2.8	-
	6000 - 7500	2.8	-	-
S* (Special)	600 - 1800	0.45	0.71	1.12
	1800 - 3600	0.71	1.12	1.8
	3600 - 6000	1.12	1.8	-
	6000 - 7500	1.8	-	-

\* R and S can only be executed with ball bearing.

To take into consideration the lifetimes of the brushes and the commutator as well as the bearing service life, you must limit the vibration values at the motor's place of installation that come from the driven machine and from the environment. The following maximum values (which are based on VDI 2056) are permissible. The values are measured at the motor's four test points.

Size	100 to 160 $V_{eff}$ [mm/s]	180 to 280 $V_{eff}$ [mm/s]
Max. permissible vibration severity	4.5	7.1

The motors are vibration-resistant at up to 3 g. Higher loads are possible on request.

## Cooling

GNA...N motors have a radial separately driven fan mounted on the side or at the top. This fan sucks the air into the motor on the B side and blows it out via the lateral openings in the drive end shield.

With version GNF...N, an external can unit can feed the cooling air to the motor via pipes. Refer to the table below for the amount of cooling air and the pressure.

### Necessary cooling air volume and pressure

Size	Air Volume [m³/s]	Pressure Head [Pa]
100	0.08	420
112	0.10	380
132	0.22	800
160	0.32	1200
180	0.40	1200
200	0.50	1400
225	0.65	1350
250	0.85	2200
280	0.95	2300

The stated values apply to the direction of air flow from the B side to the A side.

In the opposite direction, approximately 10% higher air volumes are needed.

If the cooling air is to be fed in or out via a pipe, the fall in pressure in the piping system must not be greater than 5% of the pressure head from this table.

### Fan assignment to motor

Size	Fan type	Nominal current [A]
100	BFB 398	0.33
112	BFB 398	0.33
132	BFB 635	1.4
160	BFB 752	3.8
180	BFB 752	3.8
200	BFB 880	8.1
225	BFB 880	8.1
250	FB D 09 *	14.5
280	FB D 09 *	14.5

Fan motors are rated as-standard for Δ/Y 200-265/345-460 V 50/60 Hz.

\* In the case of FB D09 separately driven fans, Y 345-460V 50 Hz is intended as the connection voltage.

The stated nominal currents are maximum values.

### Air flow monitoring

To ensure that the motor functions correctly, you must ensure that it is cooled adequately.

To monitor the flow of cooling air, you can optionally install an air flow monitoring facility in the blower.

Switching capacity of the microswitches: Resistive load cos φ 1: to 30 V DC 0.1 A or 30 - 250 V AC 5 A

Inductive load cos φ 0.6: to 30 V DC 0.1 A or 30 - 250 V AC 3 A

The contacts open when the air throughflow is too low.

## Brake assignment

for motor type	Brake type	Brake torque			Input power [W]	max. perm. switching energy Wperm. per switching operation			Switching power Pperm. [kJ/h] for operating brake	Disengaging time [s] Switching operation	Engaging time [ms] Indiv. braking	Inertia [kgm²]	max. perm. speed [min⁻¹]	Weight [kg]
		[Nm] Operat- ing brake [M2]	Holding brake [M4]	Peak load brake [M4]		Operat- ing brake	Holding brake	Peak load brake						
<b>GN.100</b>	SB 50	30	50	-	80	4500	10000	-	470	120	160	0.0005	4000	5
<b>GN.112</b>	SB 100	60	100	60	106	5000	18000	70000	560	180	250	0.0015	3500	9.5
<b>GN.132</b>	SB 200	135	200	140	170	8000	20000	90000	630	225	300	0.0040	3000	13
<b>GN.160</b>	SB 200	135	200	140	170	8000	20000	90000	630	225	300	0.0040	3000	13

For use as a holding brake the following must be observed:

Brake has a considerably increased brake torque

3 emergency stops (individual braking operations) per hour possible if evenly distributed

Switching times values are valid for switching on the AC side, in a cold state, with basic air gap and holding brake

Disengaging time – Time until the brake has completely disengaged (brake without torque)

Engaging time – Time until the brake torque is reached

M2 ... dynamic torque, M4 ... static torque

All information are valid for the installation on a horizontal shaft

The supplier must be contacted before vertical installation.

Requirements other than those indicated on request.

### Braking time / switching energy / switching capacity

It is useful to check that the brake is suited for its application. To do this, the brake energy and braking power must be determined.

#### Determining the braking time

$$t_B = \frac{\sum J \cdot n_1}{9,55 \cdot (M_B \pm M_L)} + t_0 \text{ in s}$$

$\sum J$  Total moment of inertia in  $\text{kgm}^2 = J_{\text{mot}} + J_{\text{zus}}$  (relative to the motor shaft)

$J_{\text{mot}}$  Motor moment of inertia in  $\text{kgm}^2$

$J_{\text{zus}}$  Additional moment of inertia in  $\text{kgm}^2$  (referred to the motor shaft)

$n_1$  Motor speed in RPM

$M_B$  Braking torque in Nm

$M_L$  Load torque in Nm (positively calculated if it decelerates, negatively calculated if it accelerates)

$t_0$  Time in s from the switching instant to the full extent of the braking torque (response time)

$i$  Number of working cycles per hour

#### Determining the switching energy and switching capacity

Switching energy:

Switching capacity:

$$W_R = \frac{\sum J \cdot \Delta n^2}{182.4} \cdot \frac{M_B}{(M_B \pm M_L)} \quad \text{in Joule} \quad P_R = \frac{W_R \cdot i}{1000} \quad \text{in } \frac{\text{kJ}}{\text{h}}$$

$W_{R\text{perm}} \leq$  Value from table

$P_{R\text{perm}} \leq$  Value from table

In most cases,  $t_0$  is negligible. If this is not the case and the time  $t_0$  must be reduced, you can achieve this by interrupting the magnet circuit on the DC side. However, this measure must be known before dimensioning the brake motor.

**Brake supply**

Normal voltage: 24; 96 - 120; 176V- (other voltages on request), 24 V: Supply with transformer and rectifier, 96 – 120 and 176 V: Supply using brake supply unit

The brakes can alternatively be equipped with microswitch or manually de-activated.

Switching capacity of microswitches

Ohmic load up to 30 V DC - 5 A or 250 V AC - 5 A

Inductive load up to 30 V DC - 3 A or 250 V AC - 2 A

The contact ratings apply to silver contacts

**Encoder****Direct voltage tachometers**

Type	Mounting	Direct voltage at 1000 RPM [V]	$n_{Max}$ [RPM]	Max. Nominal current [A]
GHT S 42	Hollow shaft	20	9000	0.01
GHT S 44	Hollow shaft	40	6000	0.01
GHT S 46	Hollow shaft	60	4000	0.01
REO 444 R	Coupling	60	12000	0.18
TDP 0.2 T-4	Coupling	60	9000	0.067

**Pulse encoder**

Type	Mounting	Number of pulses per revolution	Maximum frequency [kHz]	$n_{Max}$ [RPM]	Signal level [V]
DG 60 L	Coupling	125 to 5000	200	6000	5 / 24

**Pulse encoder connection**

Pin	Signal
1	$U_2$ inv.
2	+ 5V or + 24V sense
3	$U_0$
4	$U_0$ inv.
5	$U_1$
6	$U_1$ inv.
7	Alarm inv.
8	$U_2$
9	
10	0V
11	0V sense
12	+ 5V or + 24V

## Structural forms

The following designs are possible:

-IM B3, B6, B7, B8, B3/B5

Sizes 100-160 can be used in B5 to a maximum of vibration-resistant up to 3 g.

-IM V5, V6, V1/V5, V3/V6.

All normal versions of V structural forms can only be supplied in IP20 type of protection.

Higher types of protection on request.

## Encoder leads for pulse encoders

### Technical Data

#### 1. Technical description – non-trailing

- LiYCY, 5x (2x0.14mm<sup>2</sup>) + 2 x 0.5mm<sup>2</sup> copper litz wire, stranded in pairs
- Sheath PVC, grey
- 1st side: 12-pin round signal connector with 12 female contacts
- 2nd side: Free line end
- External diameter 8.5 mm ( $\pm$  4 mm)
- Bending radius:  $r \geq 170$  mm
- Nominal voltage: 250V<sub>AC</sub>

#### 2. Technical description – trailing

- Li12YC11Y, 5x (2x0.14mm<sup>2</sup>) + 2 x 0.5mm<sup>2</sup> copper litz wire, stranded in pairs
- Sheath PUR, black
- 1st side: 12-pin round signal connector with 12 female contacts
- 2nd side: Free line end
- Labelled with Baumüller logo, white
- External diameter 8.0 mm ( $\pm$  2 mm)
- Bending radius:  $r \geq 80$  mm (flexible application)
- Nominal voltage: 300V<sub>AC</sub>

### Application Information

#### Operating Temperatures

	Trailing	Non-trailing
Limit temperature	on the surface	on the surface
Application involving no movement/little movement	---	- 20° C to + 80° C
Application involving continuous movement	- 20° C to + 70° C	- 5° C to + 80° C

Laying the line on the motor

The lines must not touch the motor surface.
