Altivar 38 Telemecanique

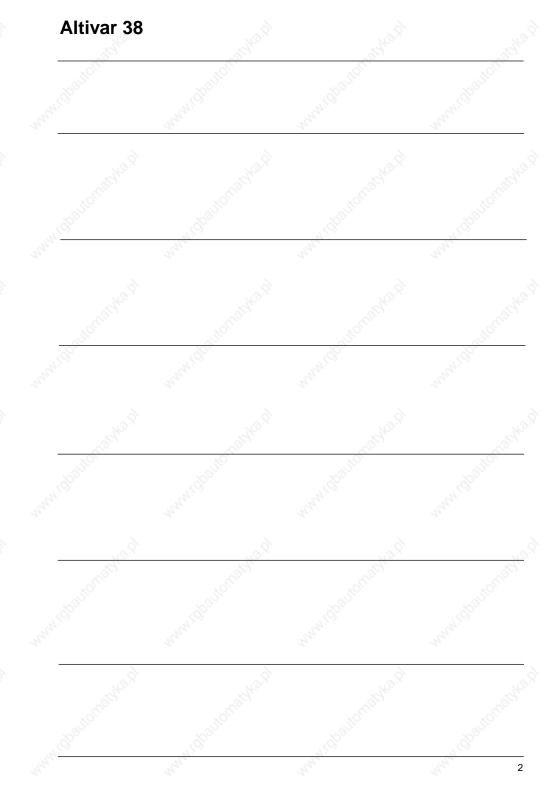

User's manual

Variable speed controllers for asynchronous motors,

When the drive is powered up, the power components and some of the control components are connected to the line supply. It is extremely dangerous to touch them. The drive cover must be kept closed.

After the ALTIVAR has been switched off and the green LED has gone out, wait for 3 to 10 minutes before working on the equipment. This is the time required for the capacitors to discharge.

The motor can be stopped during operation by inhibiting run commands or the speed reference while the drive remains powered up. If personnel safety requires prevention of sudden restarts, this electronic locking system is not sufficient: fit a cut-off on the power circuit.

The drive is fitted with safety devices which, in the event of a fault, can shut down the drive and consequently the motor. The motor itself may be stopped by a mechanical blockage. Finally, voltage variations, especially line supply failures, can also cause shutdowns.

If the cause of the shutdown disappears, there is a risk of restarting which may endanger certain machines or installations, especially those which must conform to safety regulations.

In this case the user must take precautions against the possibility of restarts, in particular by using a low speed detector to cut off power to the drive if the motor performs an unprogrammed shutdown.

Equipment should be designed in accordance with the specifications laid down in the IEC standards.

As a rule, the drive power supply must be disconnected before any operation on either the electrical or mechanical parts of the installation or machine.

The products and equipment described in this document may be changed or modified at any time, either from a technical point of view or in the way they are operated. Their description can in no way be considered contractual.

The Altivar 38 must be considered as a component: it is neither a machine nor a device ready for use in accordance with European directives (machinery directive and electromagnetic compatibility directive). It is the responsibility of the end user to ensure that the machine meets these standards.

The drive must be installed and set up in accordance with both international and national standards. Bringing the device into conformity is the responsibility of the systems integrator who must observe the EMC directive among others within the European Union.

The specifications contained in this document must be applied in order to comply with the essential requirements of the EMC directive.

Preliminary Recommendations

Acceptance

Check that the drive reference printed on the label is the same as that on the delivery note corresponding to the purchase order.

Remove the Altivar 38 from its packaging and check that it has not been damaged in transit.

Handling and storage

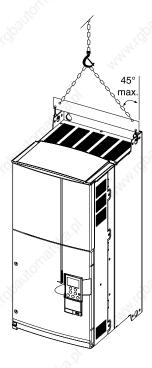

To ensure the drive is protected before installation, handle and store the device in its packaging.

Handling on installation

The Altivar 38 range comprises 9 sizes of device, with various weights and dimensions.

Small drives can be removed from their packaging and installed without a handling device.

A hoist must be used with large drives; for this reason they are supplied with 4 handling "lugs". The precautions described below must be observed:

- (4) Current values given with an additional line choke.
- (5) These power levels are for a maximum switching frequency of 2 or 4 kHz, depending on the rating, and continuous operation. Switching frequencies are detailed in the section on "Technical Specifications". Using the ATV38 with a higher switching frequency:
 - For continuous operation derate by one power rating, for example:
 - ATV38HU18N4 for 0.37 kW ATV38HD12N4 for 5.5 kW.
 - If no power derating is applied, do not exceed the following operating conditions:
 - Cumulative running time 36 s maximum per 60 s cycle (load factor 60%).
- (6) For 60 seconds.
- (7) These power levels are given for the maximum permissible switching frequency in continuous operation (2 or 4 kHz, depending on the rating).
- (8) For ATV38HU18N4 to D79N4: the Altivar 38 is fitted with an integral EMC filter.
 - For ATV38HD25N4(X) to D79N4(X): add X to the reference to receive an Altivar 38 without integral EMC filter.

For ATV38HC10N4X to C33N4X: the Altivar 38 is not fitted with an integral EMC filter. Optional external filters are available.

Available Torque

Torque characteristics:

· Variable torque applications:

- 1 Self-cooled motor: permanent useful torque
- 2 Force-cooled motor: permanent useful torque
- 3 Transient overtorque for max. 60 seconds.
- 4 Torque at overspeed with constant power

Available overtorque:

Variable torque applications:

110% of the nominal motor torque for 60 seconds.

Continuous operation

For self-cooled motors, cooling is linked to the motor speed. Derating therefore occurs at speeds of less than half the nominal speed.

Overspeed operation

As the voltage can no longer change with the frequency, induction in the motor is reduced which results in a reduction in torque. Check with the manufacturer that the motor can operate at overspeed.

Note: With a special motor, the nominal and maximum frequencies can be adjusted between 10 and 500 Hz using the operator terminal or PowerSuite tools.

Mounting and Temperature Conditions

Install the unit vertically to within +/-10 °.

Do not place it close to heating elements.

Leave sufficient free space to ensure that the air required for cooling purposes can circulate from the bottom to the top of the unit.

ATV38HU18N4 to D23N4

Free space in front of unit: 10 mm minimum.

ATV38HU18N4 to U90N4:

From - 10 °C to 40 °C: d ≥ 50 mm: no special precautions.

d = 0: remove the protective blanking cover from the top of the drive as shown overleaf (the degree of protection is then IP 20).

From 40 °C to 50 °C: d ≥ 50 mm; remove the protective blanking cover from the top of the drive as shown overleaf (the degree of protection is then IP 20).

d = 0: add control ventilation kit VW3A5882• (see ATV38 catalogue).

From 50 °C to 60 °C: d ≥ 50 mm: add control ventilation kit VW3A5882• (see ATV38 catalogue).

Derate the operating current by 2.2% per °C over 50 °C.

ATV38HD12N4 to D23N4:

From - 10 °C to 40 °C: d ≥ 50 mm: no special precautions.

d = 0: remove the protective blanking cover from the top of the drive as shown overleaf (the degree of protection is then IP 20).

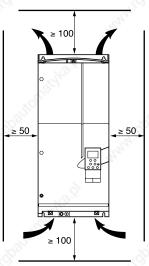

From 40 °C to 50 °C: d ≥ 50 mm: remove the protective blanking cover from the top of the drive as shown

overleaf (the degree of protection is then IP 20). Derate the current by 2.2% per °C over 40 °C.

d = 0: add control ventilation kit VW3A5882 (see ATV38 catalogue). Derate the current by 2.2% per °C over 40 °C.

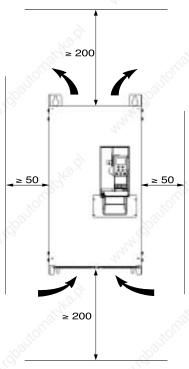

Mounting and Temperature Conditions

ATV38HD25N4(X) to D79N4(X)

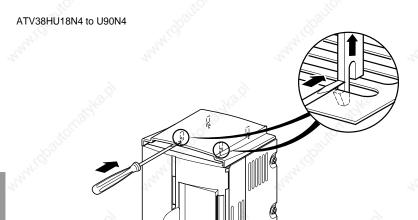

- Free space in front of unit: 50 mm minimum.
- From 10 °C to 40 °C: no special precautions. From 40 °C to 60 °C: add control ventilation kit VW3A588••• (see ATV38 catalogue). Derate the current by 2.2% per °C over 40 °C.

ATV38HC10N4X to C23N4X

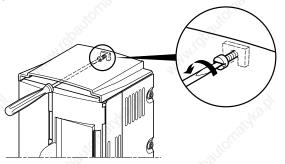

- Free space in front of unit: 50 mm minimum.
- From 10 °C to 40 °C: no special precautions.
- Up to 50 °C, derating the operating current by 2.2% for each °C above 40 °C.

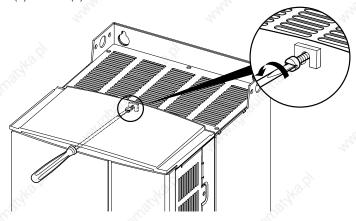

Removing the IP 41 Protective Blanking Cover

ATV38HD25N4(X) to D79N4(X)

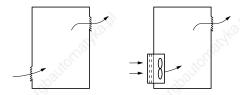

Mounting in a Wall-fixing or Floor-standing Enclosure

Observe the mounting recommendations on the previous page.

To ensure proper air circulation in the drive:

- Fit ventilation grilles
- Ensure that ventilation is adequate: if not, install forced ventilation with a filter
- Use special IP 54 filters

Dust and damp proof metal wall-fixing or floor-standing enclosure (IP 54 degree of protection)

CITCIOSUIE (IP 54 degree of protection

The drive must be mounted in a dust and damp proof casing in certain environmental conditions: dust, corrosive gases, high humidity with risk of condensation and dripping water, splashing liquid, etc.

To avoid hot spots in the drive, add a fan to circulate the air inside the enclosure, reference VW3A5882• (see ATV38 catalogue).

This enables the drive to be used in an enclosure where the maximum internal temperature can reach 60 °C.

Calculating the size of the enclosure

Maximum thermal resistance Rth (°C/W):

Rth = $\frac{\theta^{\circ} - \theta^{\circ}e}{P}$ θ° = maximum temperature inside enclosure in °C θ° = maximum external temperature in °C θ° = total power dissipated in the enclosure in W

Power dissipated by the drive: see section Selecting a drive. Add the power dissipated by the other equipment components.

Useful heat dissipation surface of enclosure S (m²): (sides + top + front panel if wall-mounted)

 $S = \frac{K}{Rth}$ $K = \text{enclosure thermal resistance per m}^2$

For metal enclosure: K = 0.12 with internal fan K = 0.15 without fan

Caution: Do not use insulated enclosures, as they have a poor level of conductivity.

Access to Terminals - Power Terminals

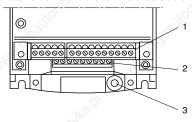

Access to terminals

Switch off the drive.

ATV38HU18N4 to ATV38HD79N4(X):

- control terminals: unlock and open the hinged cover
- power terminals: accessible on the underside of the Altivar 38

Location of terminals: on the underside of the Altivar.

- 1 Control
- 2 Power
- 3 Terminal for connection of a protective conductor, 10 mm² cross-section conforming to EN50178 (earth leakage current)

ATV38HC10N4X to HC33N4X:

- the control and power terminals can be accessed by removing the front cover

LI1 LI2 LI3 LI4	Logic inputs	Programmable logic inputs impedance 3.5 kΩ + 24 V power supply (max. 30 V) State 0 if < 5 V, state 1 if > 11 V
+ 24	Power supply for inputs	+ 24 V protected against short-circuits and overloads, min. 18 V, max. 30 V Max. current 200 mA

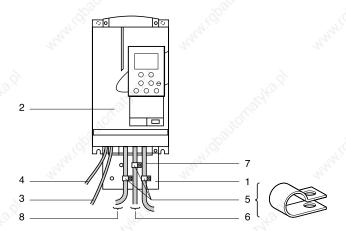

Electromagnetic Compatibility - Wiring

Altivar 38 with integral EMC filter ATV38HU18N4 to HD79N4

Principle

- · Grounds between drive, motor and cable shielding must have "high frequency" equipotentiality.
- Use shielded cables with shielding connected to the ground at both ends of the motor cable, braking resistor (if fitted) and control-signalling cables. Conduit or metal ducting can be used for part of the shielding length provided that there is no break in continuity.
- Ensure maximum separation between the power supply cable (line supply) and the motor cable.

Installation diagram

- 1 Sheet steel machine ground supplied with the drive, to be fitted as indicated on the diagram.
- 2 Altivar 38.
- 3 Non-shielded power supply wires or cable.
- 4 Non-shielded wires for the output of the safety relay contacts.
- 5 Fix and ground the shielding of cables 6, 7 and 8 as close as possible to the drive:
 - strip the cable to expose the shielding
 - use the clamps supplied to fix the stripped part of the shielding to the metal plate 1
 The shielding must be clamped tightly enough to the metal plate to ensure good contact.
- 6 Shielded cable for motor connection with shielding connected to ground at both ends. The shielding must be continuous and intermediate terminals must be in EMC shielded metal boxes.
- 7 Shielded cable for connecting the control/signalling wiring.
 For applications requiring several conductors, use small cross-sections (0.5 mm²).
 The shielding must be connected to ground at both ends. The shielding must be continuous and intermediate terminals must be in EMC shielded metal boxes.
- 8 Shielded cable for connecting braking resistor (if fitted). The shielding must be connected to ground at both ends. The shielding must be continuous and intermediate terminals must be in EMC shielded metal boxes.

Note

- If using an additional input filter, it should be mounted behind the drive and connected directly to the line supply via an unshielded cable. Link 3 to the drive is then via the filter output cable.
- The HF equipotential ground connection between the drive, motor and cable shielding does not remove the need to connect the PE protective conductors (green-yellow) to the appropriate terminals on each unit.

Electromagnetic Compatibility - Wiring

Altivar 38 without integral EMC filter ATV38HC10N4X to HC33N4X

Line chokes are compulsory if the line supply prospective short-circuit current is less than 22 kA. These chokes can be used to provide improved protection against overvoltages on the line supply and to reduce harmonic distortion of the current produced by the drive. The chokes are used to limit the line current.

Principle

- · Grounds between drive, motor and cable shielding must have "high frequency" equipotentiality.
- Use shielded cables with shielding connected to the ground at both ends of the motor cable, and controlsignalling cables. Conduit or metal ducting can be used for part of the shielding length provided that there is no break in continuity.
- Ensure maximum separation between the power supply cable (line supply) and the motor cable.

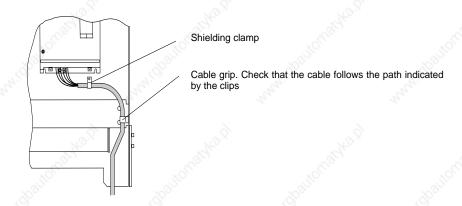

Power wiring

The power wiring should consist of cables with 4 conductors or individual cables maintained as close as possible to the PE cable. Take care to route the motor cables well away from the power supply cables. The power supply cables are not shielded. If a radio interference filter is used, the grounds for the filter and the drive should be at the same potential with low-impedance links at high frequency (fixed to unpainted metal plate with anti-corrosion treatment/machine ground wiring). The filter should be fitted as close as possible to the drive.

If the environment is sensitive to radiated radio interference, the motor cables should be shielded. On the drive side, fix and connect the shielding to the machine ground with rustproof clamps. The main function of the motor cable shielding is to limit their radio frequency radiation. Therefore, use 4-pole cables for the motor, connecting each end of the shielding in accordance with established practice for High Frequency wiring. The type of protective material (copper or steel) is less important than the quality of the connection at both ends. An alternative is to use a metal cable duct with good conductivity and no break in continuity.

Note: when using a cable with a protective sleeve (NYCY type) which fulfils the dual function of PE + screen, it must be connected correctly to both the drive and the motor (its radiation efficiency is reduced).

Control wiring

Wiring Recommendations, Use

Wiring recommendations

Power

Observe the cable cross-sectional areas recommended in the standards.

The drive must be earthed to conform with the regulations concerning high leakage currents (over 3.5 mA). Do not use a residual current device for upstream protection on account of the DC elements which may be generated by leakage currents. If the installation involves several drives on the same line, each drive must be earthed separately. If necessary, fit a line choke (consult the catalogue).

Keep the power cables separate from circuits in the installation with low-level signals (detectors, PLCs, measuring apparatus, video, telephone).

Control

Keep the control circuits away from the power cables. For control and speed reference circuits, we recommend using shielded twisted cables with a pitch of between 25 and 50 mm connecting the shielding to each end.

Recommendations for use

With power switching via line contactor:

- Avoid operating contactor KM1 frequently (premature ageing of the filter capacitors). Use inputs LI1 to LI4 to control the drive
- these steps are essential in the event of cycles:
 of less than 60 seconds for ATV38HU18N4 to HD79N4(X)
 of less than 180 seconds for ATV38HC10N4X to ATV38HC33N4X

If safety standards necessitate isolation of the motor, fit a contactor on the drive output and use the "downstream contactor control" function (consult the programming manual).

Fault relay, unlocking

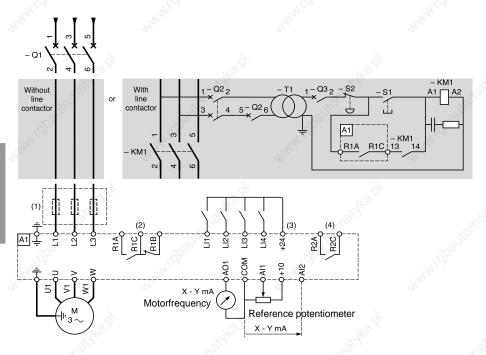

The fault relay is energized when the drive is powered up and is not faulty. It has one C/O contact at the common point.

The drive is unlocked after a fault by:

- · powering down the drive until both the display and indicator lamps go out, then powering up again
- automatically or remotely via logic input: consult the programming manual

Connection Diagrams

3-phase power supply

- (1) ATV38HC10N4X to C33N4X: Line choke compulsory. ATV38HU18N4 to D23N4: Line choke if necessary.
- (2) Fault relay contacts for remote signalling of drive status.
- (3) Internal + 24 V. If an external + 24 V supply is used, connect the 0 V from that source to the COM terminal, do not use the + 24 terminal on the drive, and connect the common of the LI inputs to the + 24 V of the external supply.
- (4) R2 reassignable relay.

Note:

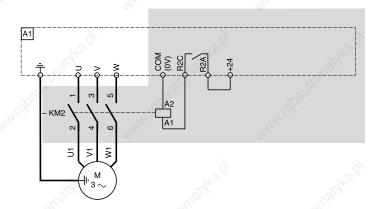

Fit interference suppressors to all inductive circuits near the drive or connected in the same circuit, such as relays, contactors, solenoid valves, fluorescent lighting, etc.

Components which can be used in association with the Altivar: see catalogue.

Connection diagrams

Diagram with downstream contactor for ATV38HU18N4 to D23N4.

The shaded part should be added to the various diagram types.

Use the "downstream contactor control" function with relay R2, or logic output LO (= 24 V) with the addition of an I/O extension card.

Consult the programming manual.

Note:

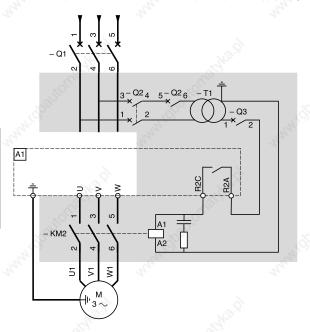

Fit interference suppressors to all inductive circuits near the drive or connected in the same circuit, such as relays, contactors, solenoid valves, fluorescent lighting, etc.

Components which can be used in association with the Altivar: see catalogue.

Connection Diagrams

Diagram with downstream contactor for ATV38HD25N4(X) to C33N4X.

The shaded part should be added to the 3-phase power supply diagram.

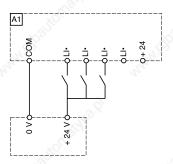

Use the "downstream contactor control" function with relay R2, or logic output LO (==24V) switching the coil using an I/O extension card.

Consult the programming manual.

Note: Fit interference suppressors to all inductive circuits near the drive or connected in the same circuit, such as relays, contactors, solenoid valves, fluorescent lighting, etc.

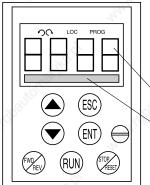

Components which can be used in association with the Altivar: see catalogue.

24 V external supply for supplying logic inputs

Scroll through menus or parameters and adjust a value.

Reverses the direction of rotation.

If control via the terminal is active:

Return to the previous menu or abort the current adjustment and return to the original value.

Command to start the motor running.

Select a menu, confirm and save a selection or adjustment.

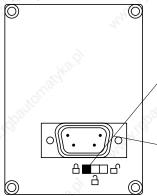

Command to stop the motor or reset the fault. The key's "STOP" function can be inhibited via the program ("CONTROL" menu).

Use the display module delivered with the ATV38 or a version 5.1 or above display module (see label on the rear view).

Rear view

Notes:

The operator terminal may be connected and disconnected with the power on. If the terminal is disconnected when control of the drive via the terminal is enabled, the drive locks in fault mode SLF.

Access locking switch:

- position : Adjustment and configuration not accessible
- position 🗋 : Adjustment accessible
- position ☐ ': Adjustment and configuration accessible Connector:

- for direct connection of the terminal to the drive

 for remote operation, the terminal can be connected via a cable provided in the VW3A58103 kit

Remote mounting of the terminal:

Use the kit, reference VW3A58103, comprising 1 cable with connectors, the kit for mounting on an enclosure door and the installation guide.

Access to Menus

The number of menus which can be accessed depends on the position of the access locking switch. Each menu is made up of a number of parameters.

Language: French, English, German, Spanish, Italian

Macro-config: variable torque (factory setting) If an input/output has been reassigned, [u5: Customised is displayed

Identification: display of the drive power and voltage

Display: display of electrical values, operation or fault

Adjust: configuration of parameters which can be accessed while the motor is rotating

Drive: motor-drive configuration

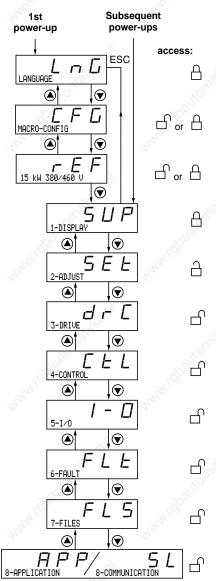

Control: configuration of drive control: terminal strip, operator terminal, RS485

I/O: configuration of the I/O assignment

Faults: configuration of the behaviour of the motor-drive in the event of a fault, and the protection devices

Files: saving and restoring the configuration or return to factory settings

Only accessible if the "application" or "communication" card is installed

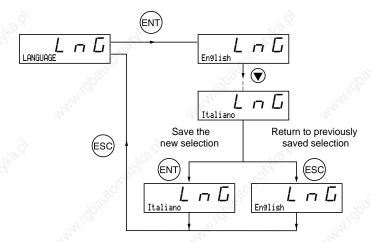

CAUTION: If an access code has already been programmed, it may be impossible to modify some menus; these may not even be visible. In this case, see the section entitled "FILES menu" explaining how to enter the access code.

Access to Menus - Programming Principle

Language:

This menu can be accessed whatever position the access switch is in, and can be modified in stop or run mode.

Example:

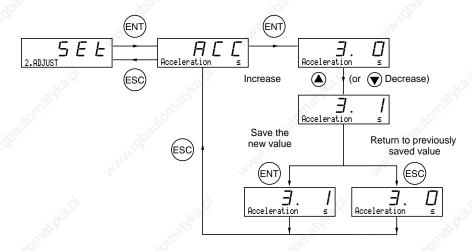

Possible selections: English (factory setting), French, German, Spanish, Italian.

Programming principle:

The principle is always the same, with 1 or 2 levels:

- 1 level: see the "language" example above.
- · 2 levels: see the "acceleration ramp" example below.

Macro-Configurations

This parameter can always be displayed and indicates whether an input/output has been reassigned. Factory macro-configuration = Variable torque

Customizing the configuration:

The drive configuration can be customized by changing the I/O assignment in the I/O menu which can be accessed in programming mode (access switch in position \bigcap).

This customization modifies the displayed macro-configuration value:

display of

EF C

I/O assignment in variable torque macro-configuration

(1) yes if $\mathbf{5FL} = \mathbf{LF}$, no if $\mathbf{5FL} = \mathbf{HFI}$ or $\mathbf{HF2I}$

The parameters with a grey background appear if a VW3 A58202 I/O extension card has been installed.

Control Menu

This menu can be accessed when the switch is in position \Box . The parameters can only be modified in stop mode with the drive locked.

Code	Description	Adjustment range	Factory setting
FCC	TermStripCon	2W- 3W (2-wire - 3-wire)	2W

Configuration of terminal strip control: 2-wire or 3-wire control.

A

Modification of this parameter requires double confirmation as it results in reassignment of the logic inputs. By changing from 2-wire control to 3-wire control, the logic input assignments are shifted by one input. The LI3 assignment in 2-wire control becomes the LI4 assignment in 3-wire control. In 3-wire control, inputs LI1 and LI2 cannot be reassigned.

Macro-configuration	Variable torque
LI1 MA	STOP
LI2	RUN forward
LI3	RUN reverse
LI4	Fault reset
LI5	ramp switching
LI6	not assigned

The I/O with a grey background can be accessed if an I/O extension card has been installed. 3-wire control (Pulse control: one pulse is sufficient to control start-up). This option inhibits the "automatic restart" function.

Wiring example:

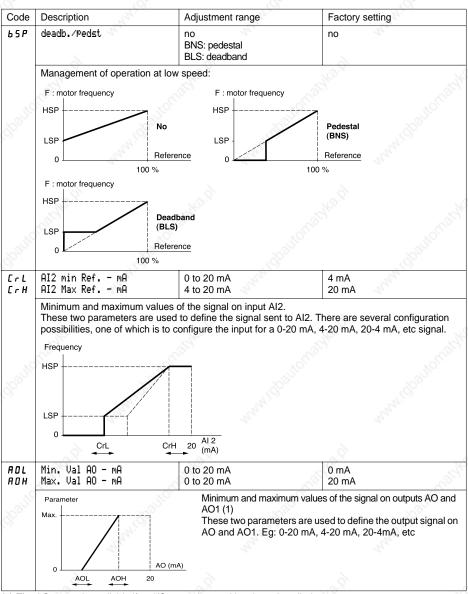

LI1: stop LI2: forward LIx: reverse ATV38 control terminals 24 V Ll1 Ll2 Llx

This option only appears if 2-wire control is configured.

Once the I/O have been reassigned, the parameters related to the function automatically appear in the menus, and the macro-configuration indicates "CUS: Customised". Some reassignments result in new adjustment parameters which the user must not forget to configure in the adjust menu:

I/O	~ ~ S	Assignments	Parameters to set
LI	RP2	Ramp switching	UCS 9ES
LI s	JOG	Jog operation	100 10F
LINE	PS2	2 preset speeds	SP2
D.	PS4	4 preset speeds	SP2-SP3-SP4
LI	PS8	8 preset speeds	5P5-5P6-5P1-5P8
LI	DCI	Injection stop	IGC
LI	PR4	4 preset PI references	P 12 - P 13
Al	PIF	PI regulator feedback	rPG-r IG-P IC-P5P
Al	SFB	Tachogenerator	dt 5
LO/R2	FTA	Frequency threshold reached	FEd
LO/R2	СТА	Current threshold reached	C F d
LO/R2	TSA	Motor thermal threshold reached	FFG
LO/R2	F2A	Frequency 2 threshold reached	F2d
LO/R2	TAD	Drive thermal threshold reached	d E d

Some reassignments result in new adjustment parameters which the user must not forget to configure in the control, drive or fault menu:

I/O		Assignments	Parameters to set
LI	-SP	- speed	5 £ r (control menu)
LI	FST	Fast stop	d[F (drive menu)
LI	RST	Fault reset	r 5 £ (fault menu)
LI	CHP	Motor switching	P[[(drive menu)
Al	SFB	Tachogenerator	5 d d (fault menu)
A+, A-, B+, B-	SAI	Summed reference	PGE, PL 5 (drive menu)
A+, A-, B+, B-	RGI	PG feedback	PGL, PL 5 (drive menu)

Function compatibility table

The choice of application functions may be limited by incompatibility between certain functions. Functions which are not listed in this table are fully compatible.

	DC injection braking	Summed inputs	PI regulator	peeds -/+	Reference switching	Freewheel stop	Fast stop	Jog operation	Preset speeds	Speed regulation with tachogenerator or encoder
DC injection braking	-85	1/60				1			Sel.	Fo

PI regulator							100	•	•	•
+/- speed					•	77.	9	1	•	
Reference switching		•		•	274				•	
Freewheel stop	←						←			
Fast stop		_	Ò.			1				3
Jog operation		1/40	•	←					+	F.
Preset speeds	Milio		•	•	•			10	10	
Speed regulation with tachogenerator or encoder	,50		•				00	500		

•	13	Incompatible functions
	Carel.	Compatible functions
Palle		Not applicable
		Priority functions (functions which cannot be active simultaneously):
←	1	The function indicated by the arrow has priority over the other.

Stop functions have priority over run commands.

Speed references via logic command have priority over analog references

Logic input application functions

Operating direction: forward/reverse

Reverse operation can be disabled for applications requiring only a single direction of motor rotation.

2-wire control

Run (forward or reverse) and stop are controlled by the same logic input, for which state 1 (run) or 0 (stop), or a change in state is taken into account (see the 2-wire control menu).

3-wire control

Run (forward or reverse) and stop are controlled by 2 different logic inputs.

LI1 is always assigned to the stop function. A stop is obtained on opening (state 0).

The pulse on the run input is stored until the stop input opens.

During power-up or a manual or automatic fault reset, the motor can only be supplied with power after prior resetting of the "forward", "reverse", and "injection stop" commands.

Ramp switching: 1st ramp: ACC, dEC; 2nd ramp: AC2, dE2

Two types of activation are possible:

- activation of a logic input Llx
- detection of an adjustable frequency threshold

If a logic input is assigned to the function, ramp switching can only be performed by this input.

Step by step operation (JOG): Low speed operation pulse

If the JOG contact is closed and then the operating direction contact is actuated, the ramp is 0.1 s irrespective of the ACC, dEC, AC2, dE2 settings. If the direction contact is closed and the JOG contact is then actuated, the configured ramps are used.

Parameters which can be accessed in the adjust menu:

- JOG speed
- anti-repeat delay (minimum time between 2 "JOG" commands)

+/- speed: Two types of operation are available.

1 Use of single action buttons: two logic inputs are required in addition to the operating direction(s). The input assigned to the "+ speed" command increases the speed, the input assigned to the "- speed" command decreases the speed.

This function accesses the STr save reference parameter in the Control menu.

2 Use of double action buttons: only one logic input assigned to + speed is required.

+ speed/- speed with double action buttons:

Description: 1 button pressed twice for each direction of rotation.

Each action closes a volt-free contact.

33	Released (- speed)	Press 1 (speed maintained)	Press 2 (+ speed)
forward button	- 6	a	a and b
reverse button	- 760.	c No	c and d

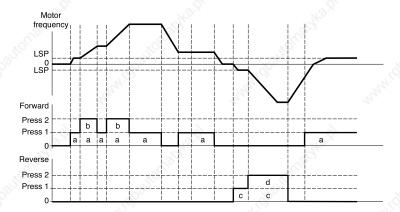

Wiring example:

ATV38 control terminals

Li1 Lix Lly +24

Llx: reverse

Lly: + speed

This type of +/- speed is incompatible with 3-wire control. In this case, the - speed function is automatically assigned to the logic input with the highest number (for example: LI3 (+ speed), LI4 (- speed)).

In both cases, the maximum speed is given by the references applied to the analog inputs. For example, connect Al1 to the +10V.

Preset speeds

2, 4 or 8 speeds can be preset, requiring 1, 2 or 3 logic inputs respectively.

The following assignment order must be observed: PS2 (LIx), then PS4 (LIy), then PS8 (LIz).

	2 preset speeds		4 preset speeds			8 preset speeds						
	Assign: LIx to PS2		Assign: Llx to PS2 then Lly to PS4			Assign: Llx to PS2 Lly to PS4, then Llz to PS8						
Llx	speed reference	Lly	Llx	speed reference	Llz	Lly	Llx	speed reference				
0	LSP+reference	0	0	LSP+reference	0	0	0	LSP+reference				
1	SP2	0	1	SP2	0	0	1	SP2				
14.5	5	1,3	0	SP3	0	1	0	SP3				
		12	1	SP4	0	1	1	SP4				
					1	0	0	SP5				
					1	0	1 ह	SP6				
					1	1	0	SP7				
					1	10	1	SP8				

To unassign the logic inputs, the following order must be observed: PS8 (Llz), then PS4 (Lly), then PS2 (Llx).

Reference switching

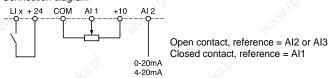

To configure the Al1/Al2 reference switching:

- Verify that the LI is not configured to "RFC: Auto/Manu" (if so, configure the LI to "NO: Not assigned").
- Configure a LI to "RFC: Auto/Manu". The second reference is then AI2.

To configure the Al1/Al3 reference switching:

- Verify that the LI is not configured to "RFC: Auto/Manu" (if so, configure the LI to "NO: Not assigned").
- Configure AI3 to "FR2: Speed Ref 2".
- Configure a LI to "RFC: Auto/Manu". The second reference is then AI3

Connection diagram

Freewheel stop

Causes the motor to stop using the resistive torque only. The motor power supply is cut.

A freewheel stop is obtained when the logic input opens (state 0).

DC injection stop

An injection stop is obtained when the logic input closes (state 1).

Fast stop

Braked stop with the deceleration ramp time reduced by a reduction factor dCF which appears in the drive menu.

A fast stop is obtained when the logic input opens (state 0).

Motor switching

This function enables two motors with different ratings to be powered by the same drive in succession, with switching performed by an appropriate sequence at the drive output. Switching must take place with the motor stopped, and the drive locked. The following internal parameters are switched automatically by the logic command:

- nominal motor current
- injection current

This function automatically disables thermal protection on the second motor.

Accessible parameter: Ratio of PCC motor ratings in the drive menu.

Fault reset

Two types of reset are available: partial or general (rSt parameter in the "fault" menu).

Partial reset (rSt = RSP):

Used to clear the stored fault and reset the drive if the cause of the fault has disappeared.

Faults affected by partial clearing:

- line overvoltage
- DC bus overvoltage
- motor phase loss
- overhauling

- communication fault
- motor overload
- loss of 4-20 mA
- external fault

- motor overheating
- serial link fault
- drive overheating
- overspeed

General reset (rSt = RSG):

This inhibits all faults (forced operation) except SCF (motor short circuit) while the assigned logic input is closed.

Forced local mode

Used to switch between line control mode (serial link) and local mode (controlled via the terminal strip or via the terminal).

Auto-tuning

When the assigned logic input changes to 1 an auto-tuning operation is triggered, in the same way as parameter tUn in the "drive" menu.

Caution: Auto-tuning will only be performed if no command has been activated. If a "freewheel stop" or "fast stop" function has been assigned to a logic input, this input must be set to 1 (active at 0). Application: Motor switching for example.

Preset Pl auto-man, Pl reference: See Pl function (page 111)

External fault

When the assigned logic input changes to 1, the motor stops (according to the configuration of the L5F StoP+f1t parameter in the Drive menu), and the drive locks in EPF external fault fault mode.

Force to keypad

Enables a LI to be used to select for local control:

If LIX=FTK and FTK=0: operation by the control terminals

If LIX=FTK and FTK=1: control by the keypad

- If LIX=FTK, the LCC function in the control menu is no longer accessible by the keypad. In consequence it is impossible to control the drive by the keypad.

 When FTK has been disactivated it is neccesary to revalidate the function LCC again in the control menu.

Analog input application functions

Input AI1 is always the speed reference.

Assignment of Al2 and Al3

Summed speed reference: The frequency references provided by Al2 and Al3 can be summed with Al1.

Speed regulation with tachogenerator: (Assignment to Al3 only with an I/O extension card with analog input): used for speed correction via tachogenerator feedback.

An external divider bridge is required to adapt the voltage of the tachogenerator. The maximum voltage must be between 5 and 9 V. A precise setting is then obtained by setting parameter dtS available in the adjust menu.

PTC probe protection: (only with an I/O extension card with analog input). Used for the direct thermal protection of the motor by connecting the PTC probes in the motor windings to analog input Al3. PTC probe characteristics:

Total resistance of the probe circuit at 20 °C = 750 Ohms.

PI regulator: Used to regulate a process with a reference and a feedback given by a sensor. In PI mode the ramps are all linear, even if they are configured differently.

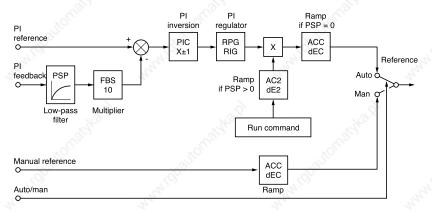

With the PI regulator, it is possible to:

- Adapt the feedback via FbS.
- Correct PI inversion.
- Adjust the proportional and integral gain (RPG and RIG).
- Assign an analog output for the PI reference, PI feedback and PI error.
- Apply a ramp to establish the action of the PI (AC2) on start-up if PSP > 0.

If PSP = 0 the active ramps are ACC/dEC. The dEC ramp is always used when stopping.

The motor speed is limited to between LSP and HSP.

Note: PI regulator mode is active if an AI input is assigned to PI feedback. This AI assignment can only be made after disabling any functions incompatible with PI (see page 106).

Auto/Man: This function can only be accessed when the PI function is active, and requires an I/O extension card with analog input

 Via logic input LI, this is used to switch operation to speed regulation if LIx = 0 (manual reference on Al3), and PI regulation if LIx = 1 (auto).

Preset references:

2 or 4 preset references require the use of 1 or 2 logic inputs respectively:

2 preset references		4 preset references			
Assign: Llx to Pr2			Assign: LIx to Pr2, then Lly to Pr4		
Llx Reference		Lly	Llx	Reference	
0	Analog reference	0	0	Analog reference	
1	1 Process max (= 10 V)		1	PI2 (adjustable)	
alle alle		1	0	PI3 (adjustable)	
B. 182		1	1.0	Process max (= 10 V)	

Encoder input application functions

(only with an I/O extension card with encoder input)

Speed regulation: Used to correct the speed via an incremental encoder or detector. (See documentation supplied with the card).

Summed speed reference: The reference provided by the encoder input is summed with Al1. (see documentation supplied with the card)
Applications:

- Synchronization of the speed of a number of drives. Parameter PLS on the "drive" menu is used to adjust the speed ratio of one motor in relation to that of another.
- Reference via encoder.

Logic output application functions

Relay R2, LO solid state output (with I/O extension card)

Downstream contactor control (OCC): can be assigned to R2 or LO

Enables the drive to control an output contactor (located between the drive and the motor). The request to close the contactor is made when a run command appears. The request to open the contactor is made when there is no current to the motor.

If a DC injection braking function has been configured, it should not be left operating too long in stop mode, as the contactor only opens at the end of braking.

Drive running (RUN): can be assigned to R2 or LO

The logic output is at state 1 if the motor power supply is provided by the drive (current present) or if a run command is present with a zero reference.

Frequency threshold reached (FTA): can be assigned to R2 or LO

The logic output is at state 1 if the motor frequency is greater than or equal to the frequency threshold set by Ftd in the adjust menu.

Frequency 2 threshold reached (F2A): can be assigned to R2 or LO

The logic output is at state 1 if the motor frequency is greater than or equal to the frequency threshold set by F2d in the adjust menu.

Reference reached (SRA): can be assigned to R2 or LO

The logic output is at state 1 if the motor frequency is equal to the reference value.

High speed reached (FLA): can be assigned to R2 or LO

The logic output is at state 1 if the motor frequency is equal to HSP.

Current threshold reached (CTA): can be assigned to R2 or LO

The logic output is at state 1 if the motor current is greater than or equal to the current threshold set by Ctd in the adjust menu.

Motor thermal state reached (TSA): can be assigned to R2 or LO

The logic output is at state 1 if the motor thermal state is greater than or equal to the thermal state threshold set by ttd in the adjust menu.

Drive thermal state reached (TAD): can be assigned to R2 or LO

The logic output is at state 1 if the drive thermal state is greater than or equal to the thermal state threshold set by dtd in the adjust menu.

Loss follower (APL): can be assigned to R2 or LO

The logic output is at 1 if the signal on the 4-20 mA input is below 2 mA.

Analog output AO and AO1 application functions

Analog outputs AO and AO1 are current outputs, from AOL (mA) to AOH (mA),

AOL and AOH can be configured between 0 and 20 mA.

Examples of AOL - AOH: 0 - 20 mA

4 - 20 mA

20 - 4 mA

Motor current (code OCR): the image of the motor rms current.

- · AOH corresponds to twice the drive nominal current.
- AOL corresponds to zero current.

Motor frequency (code OFR): the motor frequency estimated by the drive.

- AOH corresponds to the maximum frequency (parameter tFr).
- AOL corresponds to zero frequency.

Ramp output (code ORP): the image of the ramp output frequency.

- AOH corresponds to the maximum frequency (parameter tFr).
- · AOL corresponds to zero frequency.

Signed ramp (code ORS): the image of the ramp output frequency and direction.

- AOL corresponds to the maximum frequency (parameter tFr) in reverse direction.
- AOH corresponds to the maximum frequency (parameter tFr) in forward direction.
- AOH + AOL corresponds to zero frequency.

2

PI reference (code OPS): the image of the PI regulator reference.

- AOL corresponds to the minimum reference.
- AOH corresponds to the maximum reference.

PI feedback (code OPF): the image of the PI regulator feedback.

- AOL corresponds to the minimum feedback.
- AOH corresponds to the maximum feedback.

PI error (code OPE): the image of the PI regulator error as a % of the sensor range (maximum feedback - minimum feedback).

- AOL corresponds to the maximum error < 0.
- AOH corresponds to the maximum error > 0.
- <u>AOH + AOL</u> corresponds to a zero error (OPE = 0).

PI integral (code OPI): the image of the PI regulator error integral.

- AOL corresponds to a zero integral.
- · AOH corresponds to a saturated integral.

Motor power (code OPR): the image of the motor power consumption.

- AOL corresponds to 0% of the nominal motor power.
- AOH corresponds to 200% of the nominal motor power.

Motor thermal state (code THR): the image of the motor thermal state, calculated.

- AOL corresponds to 0%.
- · AOH corresponds to 200%.

Drive thermal state (code THD): the image of the drive thermal state, calculated.

- · AOL corresponds to 0%.
- AOH corresponds to 200%.

Fault Menu

This menu can be accessed when the switch is in position \Box . Modifications can only be made in stop mode with the drive locked.

Code	Description	39.	Factory setting

Files Menu

This menu can be accessed when the switch is in position ...

The operations are only possible in stop mode with the drive locked.

The terminal is used to store 4 files containing the drive configurations.

Code	Description	Factory setting
F 15 F 25 F 35 F 45	File 1 State File 2 State File 3 State File 4 State	FRE FRE FRE
Rangico,	Used to display the state of the corresponding file. Possible states: FRE: file free (state in which terminal is delivered) EnG: a configuration has already been saved to this file	NAMILE.
FOL	Operat.Type	NO
REAL POR	Used to select the operation to be performed on the files. Possible operations: NO: no operation requested (default value on each new terminal connection to the STR: operation to save the drive configuration to a file on the terminal REC: transfer the content of a file to the drive Init return the drive to factory settings A return to factory settings cancels all your adjustments and your constitution.	"i'qpunot

Operating mode

Select STR, REC or InI and press "ENT".

1 If Operat.Type = STR:

The file numbers are displayed. Select a file using ▲ or ▼ and confirm with "ENT".

2 If Operat.Type = REC:

The file numbers are displayed. Select a file using ▲ or ▼ and confirm with "ENT".

- The display indicates:

WIRING OK? H L

Check that the wiring is compatible with the file configuration.

Cancel with "ESC" or confirm with "ENT".

- The display then requests a second confirmation using "ENT" or cancellation using "ESC".
- 3 If Operat.Type = Inl:
 - Confirm with "ENT".
 - TThe display indicates:

Check that the wiring is compatible with the factory configuration.

Cancel with "ESC" or confirm with "ENT".

The display then requests a second confirmation using "ENT" or cancellation using "ESC".

At the end of each operation the display returns to the "Operat.Type" parameter set to "NO".

Files Menu

Files Menu (continued)

Code	Description	19/10	74/
COd	Password	20,	27,00
	Confidential code		

The drive configuration can be protected by a password (COd).

CAUTION: THIS PARAMETER SHOULD BE USED WITH CAUTION. IT MAY PREVENT ACCESS TO ALL PARAMETERS. ANY MODIFICATION TO THE VALUE OF THIS PARAMETER MUST BE CAREFULLY NOTED AND SAVED.

The code value is given by four figures, the last of which is used to define the level of accessibility required by the user.

Access to the menus according to the position of the access locking switch on the rear of the terminal is always operational, within the limits authorized by the code.

The Code value 0000 (factory setting) does not restrict access.

The table below defines access to the menus according to the last figure in the code.

	Last figure in the code			
Menus	Access locked	Display	Modification	
Adjustments	0 exc. 0000 and 9	30 1	2	
Level 2: Adjustments, Macro-config, Drive, Control, I/O, Faults, Files (excluding code), Communication (if card present)	0 exc. 0000 and 9	3	MANIET A	
Application (if card present)	0 exc. 0000 and 9	5	6	
Level 2 and Application (if card present)	0 exc. 0000 and 9	7	8	

For access to the APPLICATION menu, refer to the application card documentation.

The code is modified using the ▲ and ▼ keys.

If an incorrect code is entered, it is refused and the following message is displayed:

After pressing the ENT or ESC key on the keypad, the value displayed for the Code parameter changes to 0000: the level of accessibility does not change. The operation should be repeated.

To access menus protected by the access code, the user must first enter this code which can always be accessed in the Files menu.

Communication and Application Menus / Return to factory settings

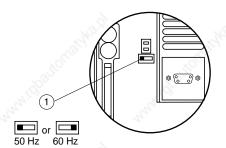

Communication or Application menu

For use with a communication or application option card, refer to the document provided with this card.

For communication via the RS485 link on the base product, refer to the document provided with the RS485 connection kit.

Return to factory settings

- In order to use the keypad only (see page117)
- Proceed using the following method:

- Switch off the drive
- Unlock and open the Altivar cover in order to access the 50/60 Hz switch (1) on the control card. If an option card is present, the selector switch can be accessed through it.
- Change the position of the 50/60 Hz switch 1 on the control card
- Switch on the drive
- Switch off the drive
- Reset the 50/60 Hz switch 1 on the control card to its initial position (nominal motor frequency)
- Switch on the drive, and it reverts to its factory configuration.

Operation - Maintenance - Spares and Repairs

Operation

Signalling on the front panel of the Altivar

green POWER LED red FAULT LED

on: Altivar powered up

- on: Altivar faulty
- flashing: Altivar locked once the "STOP" key has been pressed on the terminal or after a change to the configuration. The motor can then only be supplied with power after first resetting the "forward", "reverse", and "injection stop" commands.

Display mode on terminal screen

Displays preset frequency reference, or fault.

The display mode can be modified via the terminal: consult the programming manual.

Maintenance

Before performing any work on the drive, switch off the power supply, check that the green LED has gone off, and wait for the capacitors to discharge (3 to 10 minutes depending on the drive power rating).

The DC voltage at the + and - terminals or PA and PB terminals may reach 850 V depending on the line supply voltage.

If a problem arises during setup or operation, ensure that the recommendations relating to the environment, mounting and connections have been observed.

Servicing

The Altivar 38 does not require preventative maintenance. We nevertheless advise you regularly to:

- · Check the condition and tightness of connections
- Ensure that the temperature around the unit remains at an acceptable level and that ventilation is effective (average service life of fans: 3 to 5 years depending on operating conditions)
- · Remove any dust from the drive

Assistance with maintenance

The first fault detected is stored and displayed on the terminal display: the drive locks, the red LED (FAULT) illuminates, and fault relay R1 trips.

Clearing the fault

- Cut the power supply to the drive in the event of a non-resettable fault.
- Locate the cause of the fault in order to eliminate it.
- Reconnect the power supply: this clears the fault if it has disappeared.
- In some cases there may be an automatic restart once the fault has disappeared if this function has been
 programmed.

Spares and repairs

For spare parts and repairs to Altivar 38 drives, consult Schneider group product support.

Faults - causes - remedies

Fault displayed	Probable cause	Procedure, remedy
<i>PHF</i> Mains Phase Loss	drive incorrectly supplied or fuses blown transient fault on one phase drive supplied by DC bus	check the power connection and the fuses reset configure the "InPhaseLoss" fault (code IPL) as "No", in the FAULT menu
USF Undervoltage	line supply too low transient voltage dip damaged load resistor	check the line voltage change the load resistor
05F Overvoltage	line supply too high	check the line voltage
OHF Drive Overheated	heatsink temperature too high (<i>E H d</i> >118%)	monitor the motor load, the drive ventilation and wait for the drive to cool down before resetting
OLF Mot Overload	thermal trip due to prolonged overload (<i>EHr</i> > 118%)	check the thermal protection setting, monitor the motor load a reset will be possible after approximately 7 minutes
ObF Overbraking	braking too sudden or driving load line supply overvoltage during operation	increase the deceleration time, add a braking resistor if necessary check for any line overvoltages
<i>OPF</i> Motor Phase Loss	one phase open-circuit at the drive output	check the motor connections and that the downstream contactor is closed (if it exists) if a motor starter is being used in a macro configuration, check that the R2 relay is configured as a downstream contactor
<i>LFF</i> LossFollower	loss of the 4-20 mA signal on input Al2	check the connection of the reference circuits
OCF Overcurrent	ramp too short inertia or load too high mechanical locking	check the settings check the size of the motor/drive/load check the state of the mechanism
SCF Short Circuit	short-circuit or grounding at the drive output	check the connection cables with the drive disconnected, and the motor insulation. Check the drive transistor bridge
<i>[rF</i> Precharge Fault	load relay control fault damaged load resistor	check the connectors in the drive and the load resistor
5 <i>L F</i> RS485 Flt	incorrect connection on the drive connector port	check the connection on the drive connector port
DEF Motor Overheated	motor temperature too high (PTC probes)	check the motor ventilation and the ambient temperature, monitor the motor load check the type of probes used
£5 <i>F</i> PTC Probe Fault	incorrect connection of probes to the drive	check the connection of the probes to the drive check the probes

Faults - causes - remedies

Fault displayed	Probable cause	Procedure, remedy
<i>EEF</i> EEProm Fault	error saving in EEPROM	cut the power supply to the drive and reset
InF Internal Fault	internal fault connector fault	check the connectors in the drive
<i>EPF</i> External Fault	fault triggered by an external device	check the device which has caused the fault and reset
5 <i>PF</i> Sp. Feedbk. Loss	no speed feedback	check the connection and the mechanical coupling of the speed sensor
RnF Load Veer. Flt	non-following of ramp speed inverse to the reference	check the speed feedback settings and the wiring check the suitability of the settings for the load check the size of the motor-drive and the possible need for a braking resistor
5 <i>0F</i> Overspeed	instability driving load too high	check the settings and the parameters add a braking resistor check the size of the motor/drive/load
Cof Network Fault	communication fault on the fieldbus	check the network connection to the drive check the time-out
<i>ILF</i> Int. Comm. Flt	communication fault between the option card and the control card	check the connection of the option card to the control card
CFF Rating Fault-ENT Option Fault-ENT Opt. Missing-ENT CKS Fault - ENT	Error probably caused when changing the card: • change of rating of the power card • change of the type of option card or installation of an option card if there was not one already and if the macroconfig is CUS • option card removed • inconsistent configuration saved Pressing ENT brings up the message: Fact.Set? ENT/ESC	check the drive hardware configuration (power card, others) cut the power supply to the drive then reset save the configuration in a file in the terminal press ENT to return to factory settings
CF Config. Fault	inconsistent configuration sent to drive via serial link	check the configuration sent previouslysend a consistent configuration

Faults - causes - remedies

Malfunction with no fault display

Display	Probable cause	Procedure, remedy
No code, LEDs not illuminated	No power supply	Check power supply to drive
No code, green LED illuminated, red LED illuminated or not illuminated	Terminal defective	Change the terminal
r d ¥ green LED illuminated	Drive in line mode with communication card or RS 485 kit An LI input is assigned to "Freewheel stop" or "Fast stop", and this input is not energized These stops are controlled by loss of the input	Set parameter LI4 to forced local mode then use LI4 to confirm this forced mode Connect the input to 24 V to disable the stop
