* SERVICE MANUAL *
TNC 415B / 425

Changes/Developments
We are constantly working on technical improvements of our products.
For this reason, details described in this manual may differ slightly from your control. In this case, please order a revised service manual from us.

Duplication
This manual is provided subject to the condition that no part of it shall be duplicated in any form without our prior consent.

Issue 11/2006

valid for the software versions	TNC 415B/425:	NC Software 259 93*	(Standard)
	TNC 415F/425E:	NC Software 259 94*	(Export)
	TNC 415B/425:	NC Software 280 54*	(Special Software)
	TNC 415F/425E:	NC Software 280 56*	(Export)

1. How to Use this Service Manual

The service manual TNC 415B/425 can be used to diagnose, locate and eliminate errors on machine tools controlled by TNC.

In order to correctly judge the problems in an NC-controlled machine tool, fundamental knowledge of the machine tool and its drives as well as their interaction with the control and the measuring systems is required. Incorrect behaviour of the machine tool can also result from improper use of the control, NC-programming errors and incorrect or not properly optimized machine parameters.

For further information in this respect please refer to the

- **Documentation of the machine tool manufacturer**
- **Operating Manual** (HEIDENHAIN)
- **Technical Manual** (HEIDENHAIN).

The Technical Manual is not enclosed with every control. In general, it is only supplied to the machine tool manufacturer and is updated by HEIDENHAIN, Traunreut. Therefore, it is absolutely necessary to contact the machine tool manufacturer, if errors occur that are due to a machine parameter or to the interface of the control. Support will, however, also be provided by the HEIDENHAIN service department and agencies. Telephone numbers, addresses and telex/fax numbers can be found on the back side of the cover page and the back side of the service manual.

2. Minor Error Messages

TNC 415B/425 features a comprehensive integral monitoring system to avoid input and operation errors, to locate errors and technical defects of the entire equipment (TNC, measuring systems, machine tool, cables etc.). The monitoring system is a fixed component of the TNC hardware and software; it is always active when the control is switched on. If a technical defect or an operation error is detected, an error message in plain language is displayed on the screen.

To erase **minor error messages**, press CE .

Further error messages are described in the

- **Operating Manual TNC 407/415B/425**
- **Technical Manual TNC 407/415/425**
- **Documentation by the machine tool manufacturer**
- **Operating Instructions FE 401 B**.

2.1 Causes of Minor Error Messages

OPERATING PARAMETERS ERASED

- With new and exchange controls, the machine parameters are always erased
- Defective buffer batteries, accumulator or capacitor
- RAM error on the processor board
- Software exchanged

LIMIT SWITCH <AXIS>

- "Manual" Operating Mode
  The preset **software limit** switch has been reached during traverse with the axis address keys.
- "Automatic" Operating Mode
  The **calculated position** of the current block is beyond the software limit switch range or beyond the additional limit (set with the MOD function <AXIS LIMIT>). The positioning is not performed.

Machine Parameters for the Software Limit Switches

	X+	X-	Y+	Y-	Z+	Z-
Default setting	910.0	920.0	910.1	920.1	910.2	920.2
Activation via PLC [1]	911.0	921.0	911.1	921.1	911.2	921.2
Activation via PLC [1]	912.0	922.0	912.1	922.1	912.2	922.2

	IV+	IV-	V+	V-
Default setting	910.3	920.3	910.4	920.4
Activation via PLC [1]	911.3	921.3	911.4	921.4
Activation via PLC [1]	912.3	922.3	912.4	922.4

[1] PLC markers M 2816 and M 2817

POWER INTERRUPTED

- After a reset signal of the power supply (e.g. line voltage drops)
- Important machine parameters may have been changed:
  e.g. MP 210, MP 410.3, MP 730, MP 3240.1, MP 7210, MP 7310

POSITIONING ERROR

- The servo lag monitor set in the machine parameters 1410.X or 1710.X has responded.
  (Check the run-in behaviour of the axis; readjust, if necessary.)

PLC PROGRAM NOT TRANSLATED

- After editing, the PLC program must be compiled (translated) anew.

PLC: ERROR 00	marker	2924	
to	to		— set
PLC: ERROR 99	marker	3023	

- Instead of PLC: ERROR 00 to 99 another dialogue may be displayed with customized PLC programs. For further information please contact your machine tool manufacturer.

NOTES

3. Major Error Messages and their Causes

The integrated monitoring system distinguishes between minor and gross errors. Gross errors are characterized by a **blinking display** (e.g. malfunctions of the encoders, of the drives and data processing errors).
If a gross error occurs, the control opens the contact **"Control Ready for Operation"**. This causes an emergency stop of the machine tool.

By switching off the main switch or by pressing END, the emergency stop state can be reset, provided that the error cause has been eliminated.

Display (blinking)	**Error Cause**
PROCESSOR CHECK ERROR YX	X = 0 CRC sum control data incorrect 1 CRC sum machine parameters incorrect 2 Check sum NC-memory incorrect 3 Test plane incomplete / will not run 4 Crosstalk between data bits in RAM 5 Crosstalk between addresses in RAM 6 Stack overflow 7 CRC sum PLC program ASCII 8 CRC sum PLC program OP-Code 9 CRC sum test section A Software error B Wrong interrupt Differentiation with register V0: 08 bus error 0C address error 10 illegal instruction 14 division by 0 18 error output for CHK command (check range) 20 error output for TRAPV command (trap on overflow) 24 privilege infringement (supervisor command in the user mode) 28 emulator trap 2C emulator trap 30 - 34 - 38 - 3C interrupt vector not initialized 40 interrupt vector not initialized 44 interrupt vector not initialized 48 interrupt vector not initialized 4C - 50 - 54 - 58 - 5C - 60 false interrupt (with priority 0) 64-7C interrupt auto-vector 4-7, user interrupt $100-$3FC 94-BC TRAP #5 - #15

Display (blinking)	Error Cause

Check the structure of the subprogram) 54 CASE arguments are larger than the number of entries in the table 55 No access to error texts / dialogue texts

1) Only active with compatibility mode TNC 355

Display (blinking)	Error Cause
ERROR IN PLC-PROGRAM X	X = 7 Called label not defined 8 No end-program condition found (the program does not contain an EM instruction, or it contains a JP instruction without a LBL instruction following.) 9 Program is too long (RAM overflow) (insufficient memory for the program code to be generated.)
ERROR IN PLC-PROGRAM XX	XX = 10 Assign with parenthesis (an =, S, SN, R, RN or PS instruction has been programmed, although arithmetic parenthesis are open) 11 Excessive nesting of parentheses (more than 16 parentheses are open) 12 Jump within a gating sequence (unconditional jump has been programmed, although the gating sequence was not closed with an Assign) 13 "Close Parenthesis" without "Open Parenthesis" (a "Close Parenthesis" command was programmed, although no parentheses were open) 14 Label within parentheses (a LBL instruction has been programmed, although parentheses are open) 15 Label within a gating sequence (a LBL instruction has been programmed, although the previous gating was not closed with an Assign) 16 Jump within parentheses (a jump instruction has been programmed, although parentheses are open) 17 Parentheses open at the end of a block (an EM instruction has been programmed, although parentheses are open) 18 Label defined twice 19 Logic Assign missing (a Word Assign or gating has been programmed, although the previous Logic-gating was not closed with a Assign) 20 Logic Assign missing (a Word instruction has been programmed, although the previous Logic-gating was not closed with an Assign) 21 Word accumulator not loaded (a Word Assign or gating has been programmed, although the Logic accumulator does not contain a definite value) 22 Logic accumulator not loaded (a Logic has been programmed, although the Logic accumulator does not contain a definite value)

Display (blinking)	Error Cause
ERROR IN PLC-PROGRAM XX (continued)	23 Accumulators not loaded on "Open Parentheses" (an A[, AN[, O[, ON[, XON[command has been programmed, although neither the word nor the logic accumulator has been gated or loaded) 24 Incorrect type of parentheses result (a different type has been calculated in the parentheses from that which was defined in the "Open Parentheses" command, i.e. logic instead of word or vice versa) 25 Conditional jump with incorrect logic accumulator (a conditional jump has been programmed, although the logic accumulator does not contain a definite value) 26 Empty CASE instruction 27 "END-CASE" missing

NOTES

Error Messages GROSS POSITIONING ERROR: Axes with Analogue Speed Controller

Display (blinking)	Error Cause
GROSS POSITIONING ERROR <AXIS> YA	**Positioning (Servo Lag) Monitoring** - Operation with feed forward control: position monitoring range exceeded (range defined in MP1420.X) - Operation with servo lag: servo lag monitoring range exceeded (range defined in MP1720.X) - Operation with gantry axes: positions of master and slave axes deviate by more than the value set in MP855.X. (displayed axis = slave axis)
GROSS POSITIONING ERROR <AXIS> YB	**Monitoring of the Analogue Voltage Limit** - The nominal voltage calculated by the control has reached its limit of ± 10 V (± 20 V for spindle). (only with feed forward control)
GROSS POSITIONING ERROR <AXIS> YC	**Movement Monitoring** - The path actually traversed in a certain time is less than ¼ of or more than 4x the nominal value calculated by the control. (can be influenced via MP1140.x)
GROSS POSITIONING ERROR <AXIS> YD	**Standstill Monitoring** - The deviation from the nominal position of an axis in standstill has exceeded the value programmed in the machine parameter MP1110.x.
GROSS POSITIONING ERROR <AXIS> YE	**Monitoring of the Offset Voltage** - The offset voltage limit of 100mV has been reached during an automatic offset adjustment with MP1220. (see section 18.5)
	Y = CPU number 1 = main processor 2 = geometry processor 3 = CLP processor

Error Location

When the error message GROSS POSITIONING ERROR is displayed, the error may be located in any element of the closed loop.

e.g.- Error in control (e.g. CLP board)
- Excessive offset voltage at the servo amplifier
- Incorrect speed adjustment at the servo amplifier
- Monitoring function of servo amplifier has responded (e.g. monitoring of current intensity)
- Electrical defect at the servo amplifier
- Mechanical error (bearing, spindle, guides)
- Excessive mechanical forces on a drive

Error Messages GROSS POSITIONING ERROR: Axes with Integrated Digital Speed Controller

Display (blinking)	Error Cause
GROSS POSITIONING ERROR <AXIS> YA	**Positioning (Servo Lag) Monitoring** - Operation with feed forward control: position monitoring range exceeded (range defined in MP1420.X) - Operation with servo lag: servo lag monitoring range exceeded (range defined in MP1720.X) - Operation with gantry axes: positions of master and slave axes deviate by more than the value set in MP855.X. (displayed axis = slave axis)
GROSS POSITIONING ERROR <AXIS> YB	**Monitoring of the Analogue Voltage Limit** - The nominal voltage calculated by the control has reached its limit of ± 10 V (± 20 V for spindle). (only with feed forward control)
GROSS POSITIONING ERROR <AXIS> YC	**Movement Monitoring** - The difference between the path information of the position encoder (LS) and that of the speed encoder (ROD) has reached the tolerance limit defined in MP1970.x.
GROSS POSITIONING ERROR <AXIS> YD	**Standstill Monitoring** - The deviation from the nominal position of an axis in standstill has exceeded the value programmed in the machine parameter MP1110.x.
GROSS POSITIONING ERROR <AXIS> YE	**Monitoring of the Offset Voltage** - The offset voltage limit of 100mV has been reached during an automatic offset adjustment with MP1220. (see section 18.5)
GROSS POSITIONING ERROR <AXIS> YF	**Monitoring of the Integrated Digital Speed Controller** - The monitoring limit of the integrated speed controller (MP1910.x) has responded.
	Y = CPU number 1 = main processor 2 = geometry processor 3 = CLP processor

Error Location

When the error message GROSS POSITIONING ERROR is displayed, the error may be located in any element of the closed loop.

e.g.:
- Error in control (e.g. CLP board)
- Excessive offset voltage at the servo amplifier
- Monitoring function of servo amplifier has responded (e.g. monitoring of current intensity)
- Electrical defect at the servo amplifier
- Motor, tachometer, encoder or cabling defective
- Mechanical error (bearing, spindle, guides)
- Excessive mechanical forces on a drive

Display (blinking)	Error Cause
ENCODER <AXIS> DEFECTIVE YA	Signal amplitude error — position encoder
ENCODER <AXIS> ` DEFECTIVE YA	Signal amplitude error — speed encoder
ENCODER <AXIS> DEFECTIVE YB	Signal frequency error — position encoder
ENCODER <AXIS> ` DEFECTIVE YB	Signal frequency error — speed encoder
ENCODER <AXIS> DEFECTIVE YC	Error with distance-coded scale — position encoder
ENCODER <AXIS> `DEFECTIVE YC	Error with distance-coded scale — speed encoder Y = CPU number: 1 = main processor, 2 = geometry processor, 3 = CLP processor **Error Causes:** - Encoder not connected - Cable damaged - Glass scale contaminated or damaged - Scanning head defective - Encoder monitoring system defective Checking the encoders: see section 13
WRONG REFERENCE POINT	Wrong reference mark spacing entered with distance-coded linear encoders (counting error caused by the measuring system or the logic unit)
TNC OPERATING TEMP. EXCEEDED	Temperature inside the logic unit has exceeded + 70°C
EMERG. STOP DEFECTIVE YX	YX = 1(1. emergency stop test 1) 2. emergency stop test 1. 3. emergency stop test - Error during the test routine "Control ready for operation" when the machine is switched on (see section 19.4)
EMERGENCY STOP PLC	This error message is only generated, if the marker 2815 is set without additional marker (M2924 - M3023).

Display (blinking)	Error Cause
PLC: Error 00 [1] marker 2924 to **PLC: Error 99** [1] marker 3023	— and marker 2815 set

NOTES

10. Power Supply

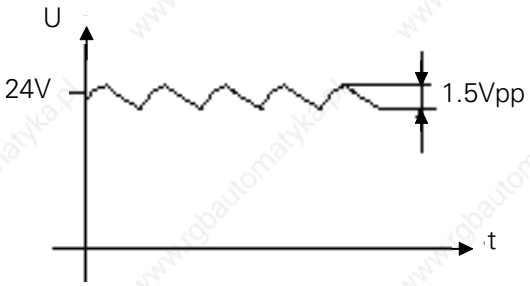
10.1 External Power Supply Requirements

The voltages must correspond to the following definitions:

Assembly		Power Supply	Voltage Range DC Mean Value	Max. Current Consumption	Power Consumption
LE	NC	24V - (VDE 0551)	lower limit 20.4V ⎓ upper limit 31V ⎓ [1]	LE 415/425: 1.5A	LE 415/425: approx. 36W
	PLC	24V - (VDE 0550)		1.8A if half of the inputs/outputs are active simultaneously	approx. 6W if approx. 1/3 of the inputs/outputs are active simultaneously
PL 400 PL 410				21A if half of the inputs/outputs are active simultaneously	approx. 25W if approx. 1/3 of the inputs/outputs are active simultaneously
PA 110				approx. 100mA	approx. 2.9W

[1] Voltages up to 36V ⎓ are permissible with t < 100ms.

10.1.1 NC Power Supply

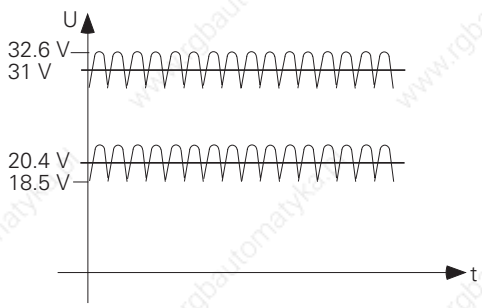


The NC part of the LE must not be connected to the control voltage of the machine tool. It requires its own external power supply generated separately according to the German standard VDE 0551.
24V DC voltage with a permissible AC component (ripple voltage) of 1.5Vpp (recommended filtering capacitor 10 000µF/40V -).

10.1.2 PLC Power Supply

The PLC part (PLC inputs and outputs) of the LE, PL and PA is operated with a control voltage of 24V- of the machine tool (generated according to VDE 0550).

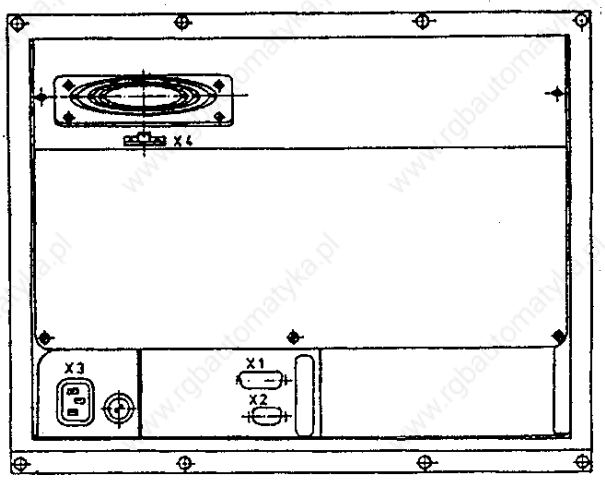
The installation and connection of the measuring resistors and the analogue inputs (PL 410, PA 110) must be safe from contact according to VDE 0160 (section 5.5.1).
If this cannot be ensured, PLC and PL 410 (PA 110) have to be powered according to VDE 0551.
Superimposed AC voltage components arising from a non-controlled three-phase bridge connection with a ripple factor of 5% (see German standard DIN 40110/10.75, section 1.2) are permissible. Thus the highest absolute value for the upper voltage limit is 32.6V; the smallest value for the lower voltage limit is 18.5V.



The 0V line of the PLC power supply must be connected to the central signal ground (line ∅ ≥ 6mm^2) of the machine tool. The ground connector on the PL410 housing must be connected to the protective ground (line ∅ ≥ 6mm^2). To avoid ground loops the measuring voltage at the analogue inputs must not be grounded.

10.1.3 Power Supply of the Visual Display Units

BC 110

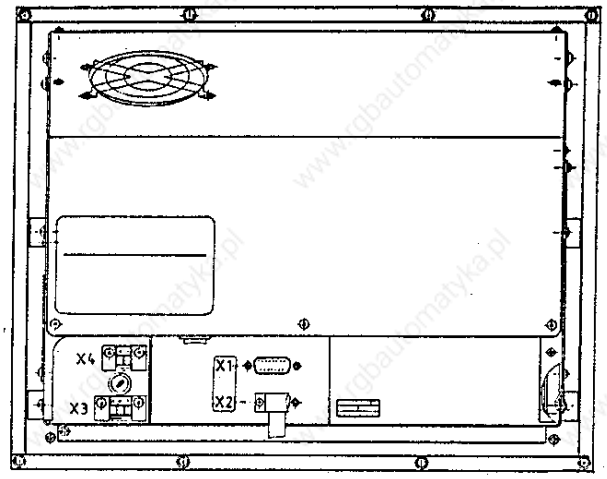


X1 = connection of logic unit
X2 = keyboard connection (for soft keys)

X3 = Line connection		
Line voltage	110 V~	220 V~
Voltage range	85 ... 132 V~	170 ... 264 V~
Line fuse	F 3.15 A	F 3.15 A
Frequency	49 ... 61 Hz	
Power consumption	60 W	

X4 = DC connection for fan	
Pin designation	Assignment
1	+ 24 V
2	0 V

BC 110B



X1 = connection of logic unit
X2 = keyboard connection (for soft keys)

X3 = Line connection		
Line voltage	110 V~	220 V~
Voltage range	85 ... 132 V~	170 ... 264 V~
Line fuse	T 2.0 A	T 2.0 A
Frequency	49 ... 61 Hz	
Power consumption	60 W	

X4 = Voltage output for testing	
Pin designation	Assignment
+	6 V
-	0 V

Note: The fan of BC 110B is supplied internally with + 24V.

10.2 Power Supply of the NC

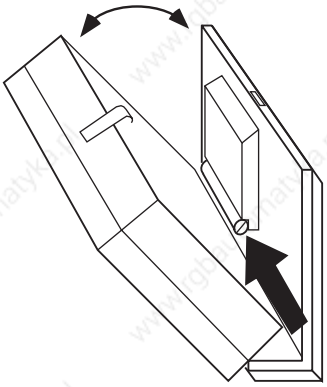
The power supply line of the NC is connected to the terminals of X31.

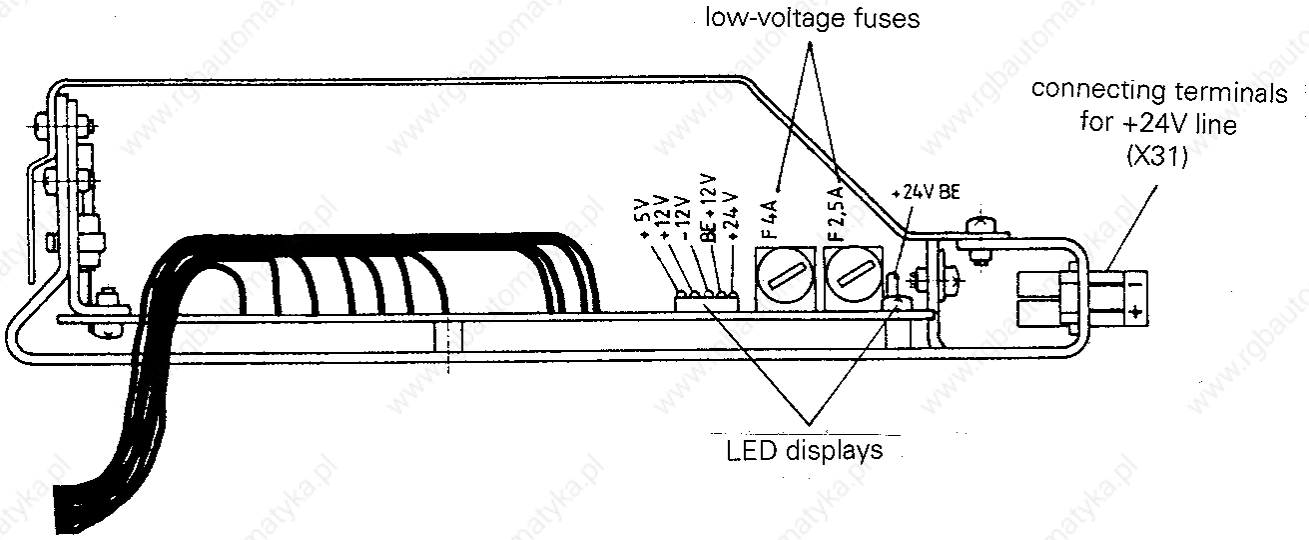
X31 NC power supply

Pin No.	Assignment
1	+ 24 V
2	0 V

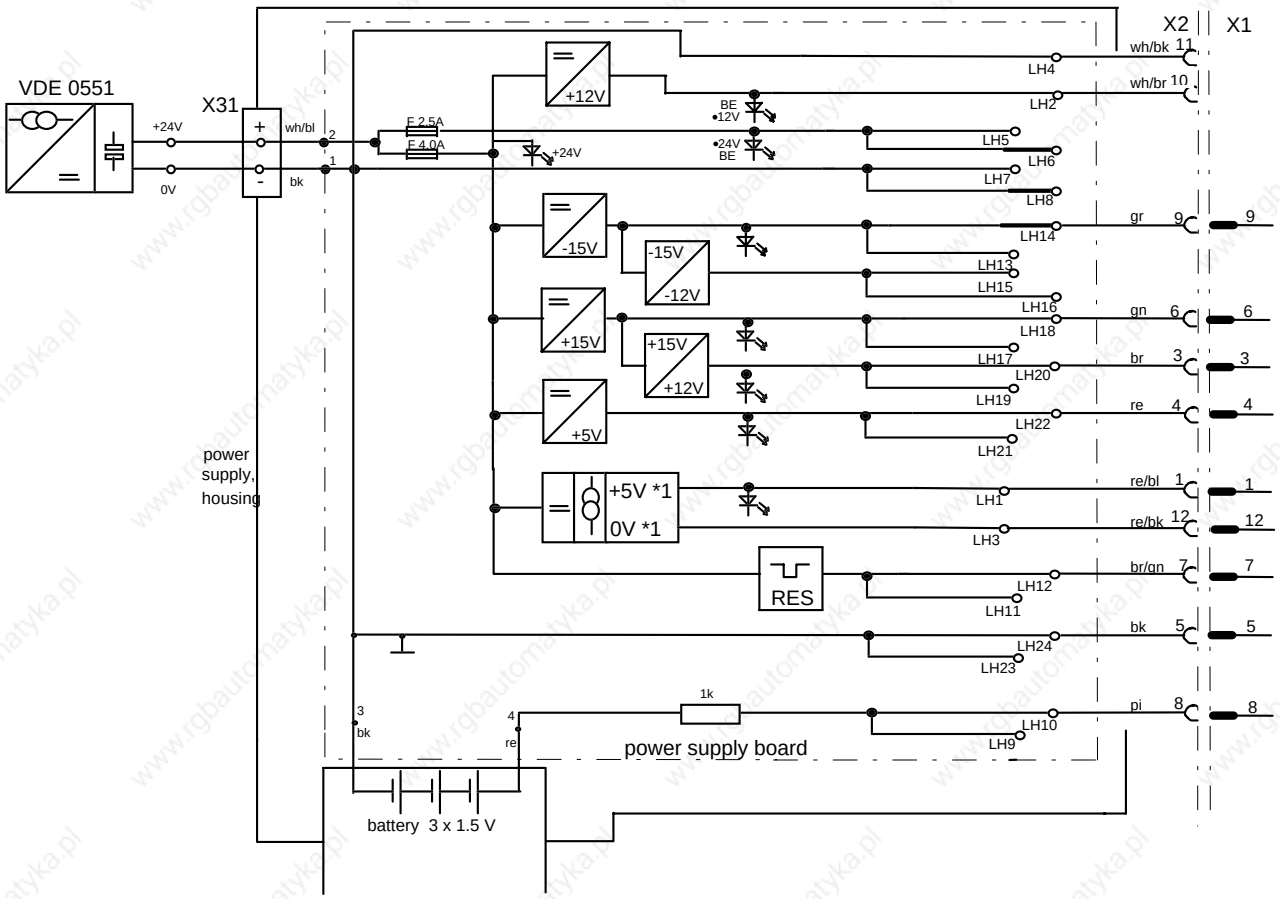
The different voltages for the LE are transformed from the voltage fed (+24V) in the POWER SUPPLY assembly (see block diagrams in section 10.2.1).

The input and output voltages are displayed by LEDs. The states of the individual voltages are only displayed approximately by the LEDs. The exact values must be measured; the measured values must correspond to the table in section 10.2.1.





10.2.1 NC Power Supply: Block Diagram



X2: connector (12-pin) of connecting cable "power supply <-> processor board"
X1: socket (12-pin) on processor board

Voltage Table

Test point on power supply board	Reference point on power supply board	Output	UNOM [V]	UMIN [V]	UMAX [V]	INOM [A]
LH22	LH24 (0V)	+ 5V (UP)	+ 5.05	+ 5.00	+ 5.10	2.5
LH20	LH24 (0V)	+ 12V	+ 12	+ 11.4	+ 12.6	0.1
LH18	LH24 (0V)	+ 15V	+ 15.0	+ 14.4	+ 15.6	0.15
LH14	LH24 (0V)	- 15V	- 15.0	- 14.4	- 15.6	0.08
LH10	LH24 (0V)	+ UBATT	+ 4.5	+ 3.9	-	approx. 20 µA
LH1	LH3 (0V*1)	+ 5V * 1 1)	+ 5	+ 4.75	+ 5.25	0.3
LH12 (reset) 2)						

1) potential-free voltage
2) reset U_{Lmax} = 0.4 V, U_{Hmin} = 3.9 V

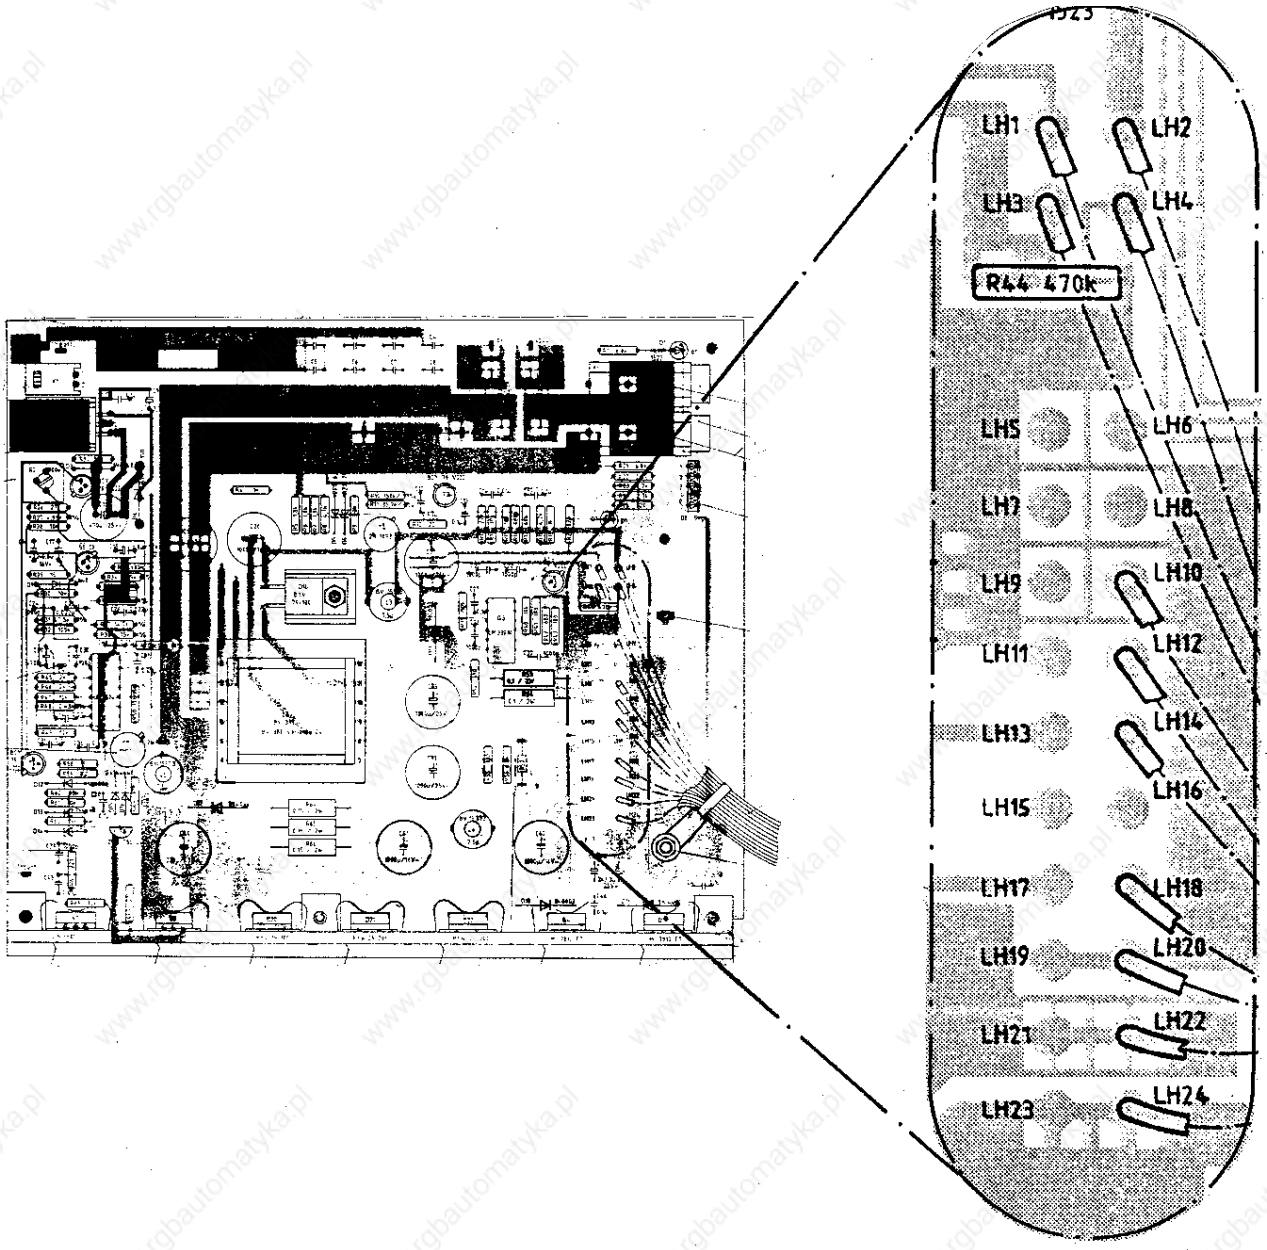
10.3 Checking the Power Supply Unit

Two low-voltage fuses are located on the POWER SUPPLY assembly. The fuse F 2.5A protects the output voltage of +24V BE (not required for TNC 415B/425), and the fuse F 4.0A protects the remaining voltages (see block diagram in section 10.2.1). If an error occurs in the power supply (all voltages missing), first check the +24V at the supply line (2-pin terminal strip X31) and then the low-voltage fuse F 4.0A.

The voltages can be measured directly on the power supply board, the processor board and the CLP board (sections 10.3.1 and 10.3.2).
The values and their tolerances can be seen from the corresponding tables. If the measured values deviate distinctly from the values in the table, the power supply assembly is defective.

Observe the safety instructions!
The power supply unit does not work without load.
(Basic load is required)

10.3.1 Test Points on the Power Supply Board



Voltage Table

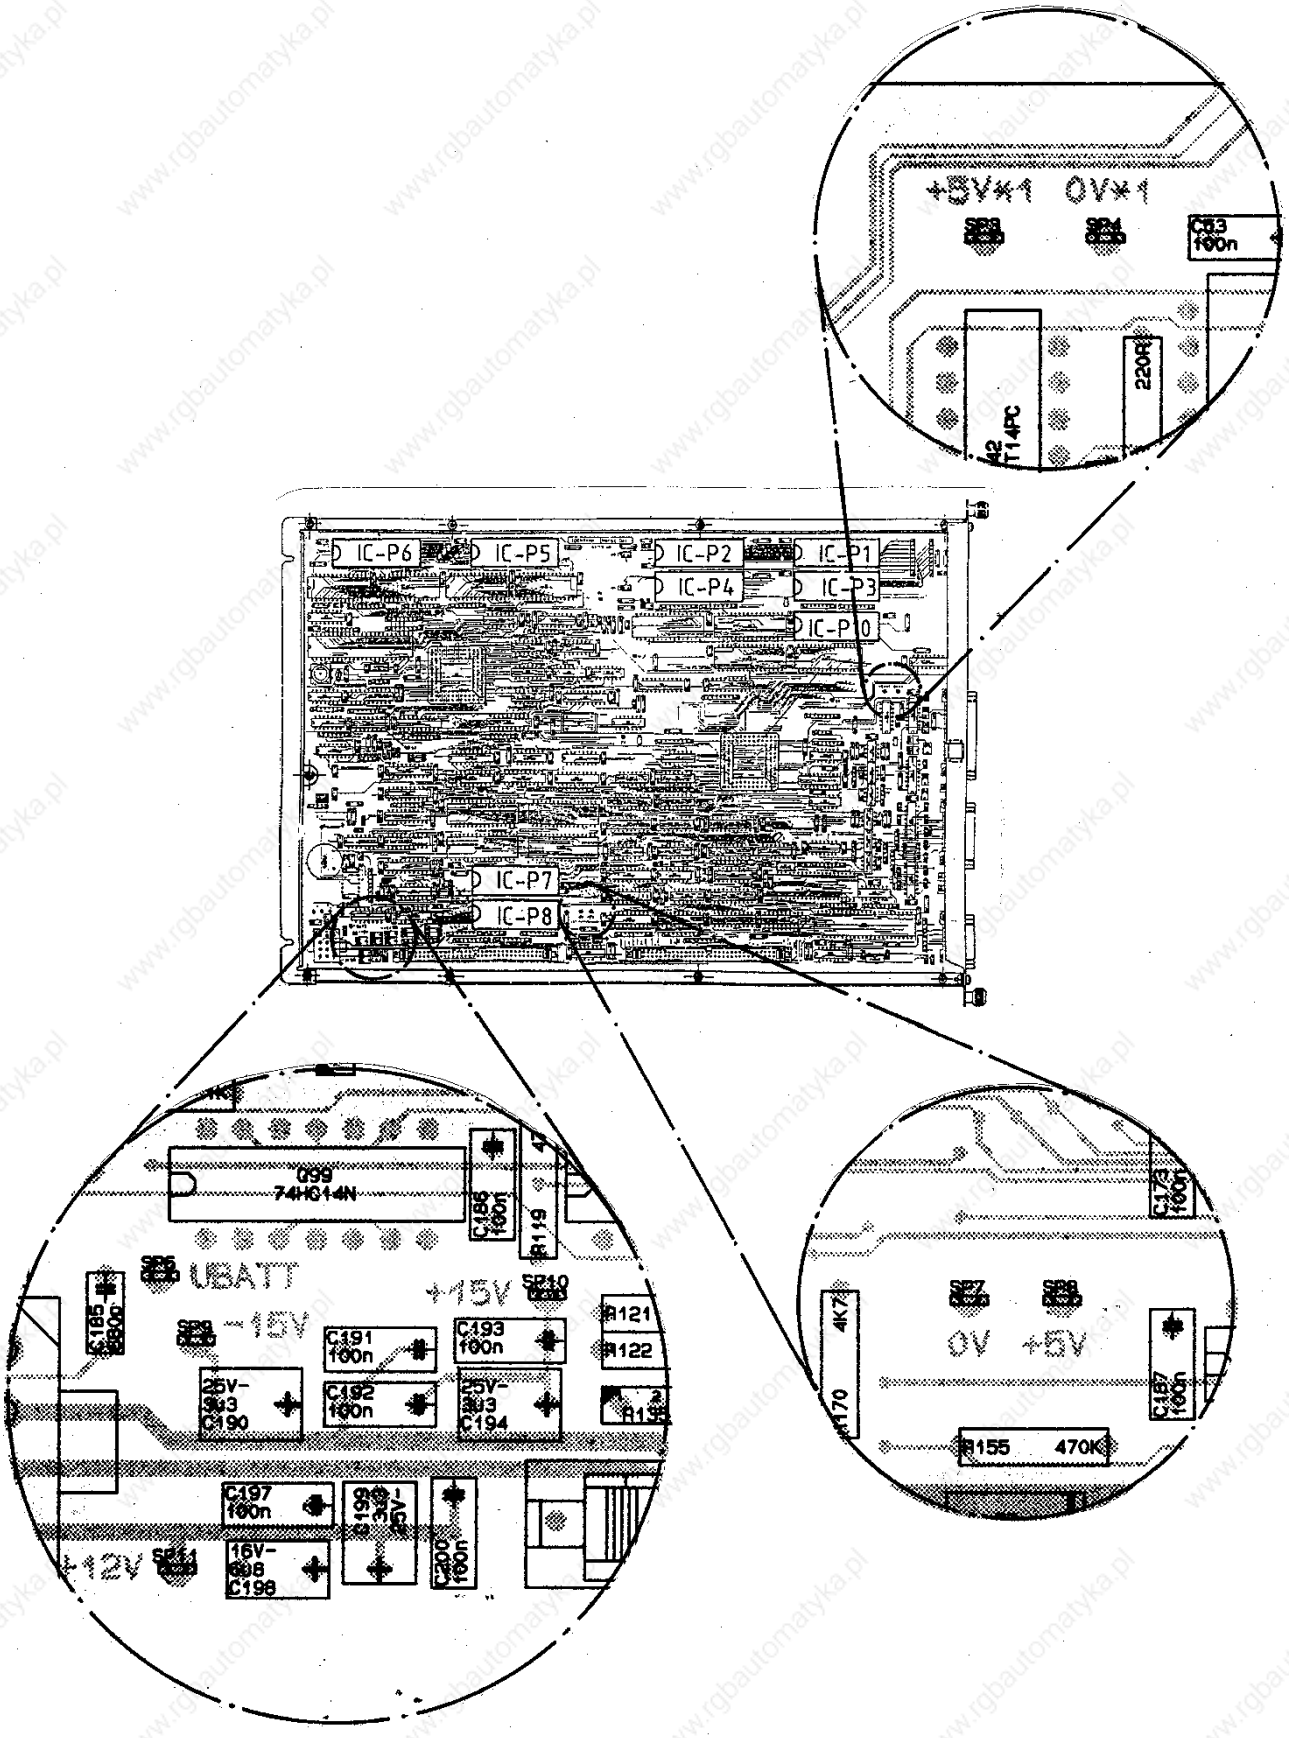
Test point on power supply board	Reference point on power supply board	Output	U_{NOM} [V]	U_{MIN} [V]	U_{MAX} [V]	I_{NOM} [A]
LH22	LH24 (0V)	+ 5V (UP)	+ 5.05	+ 5.00	+ 5.10	2.5
LH20	LH24 (0V)	+ 12V	+ 12	+ 11.4	+ 12.6	0.1
LH18	LH24 (0V)	+ 15V	+ 15.0	+ 14.4	+ 15.6	0.15
LH14	LH24 (0V)	- 15V	- 15.0	- 14.4	- 15.6	0.08
LH10	LH24 (0V)	+ U_{BATT}	+ 4.5	+ 3.9	-	approx. 20 µA
LH1	LH3 (0V*1)	+ 5V * 1 [1]	+ 5	+ 4.75	+ 5.25	0.3
LH12 (reset) [2]						

[1] potential-free voltage

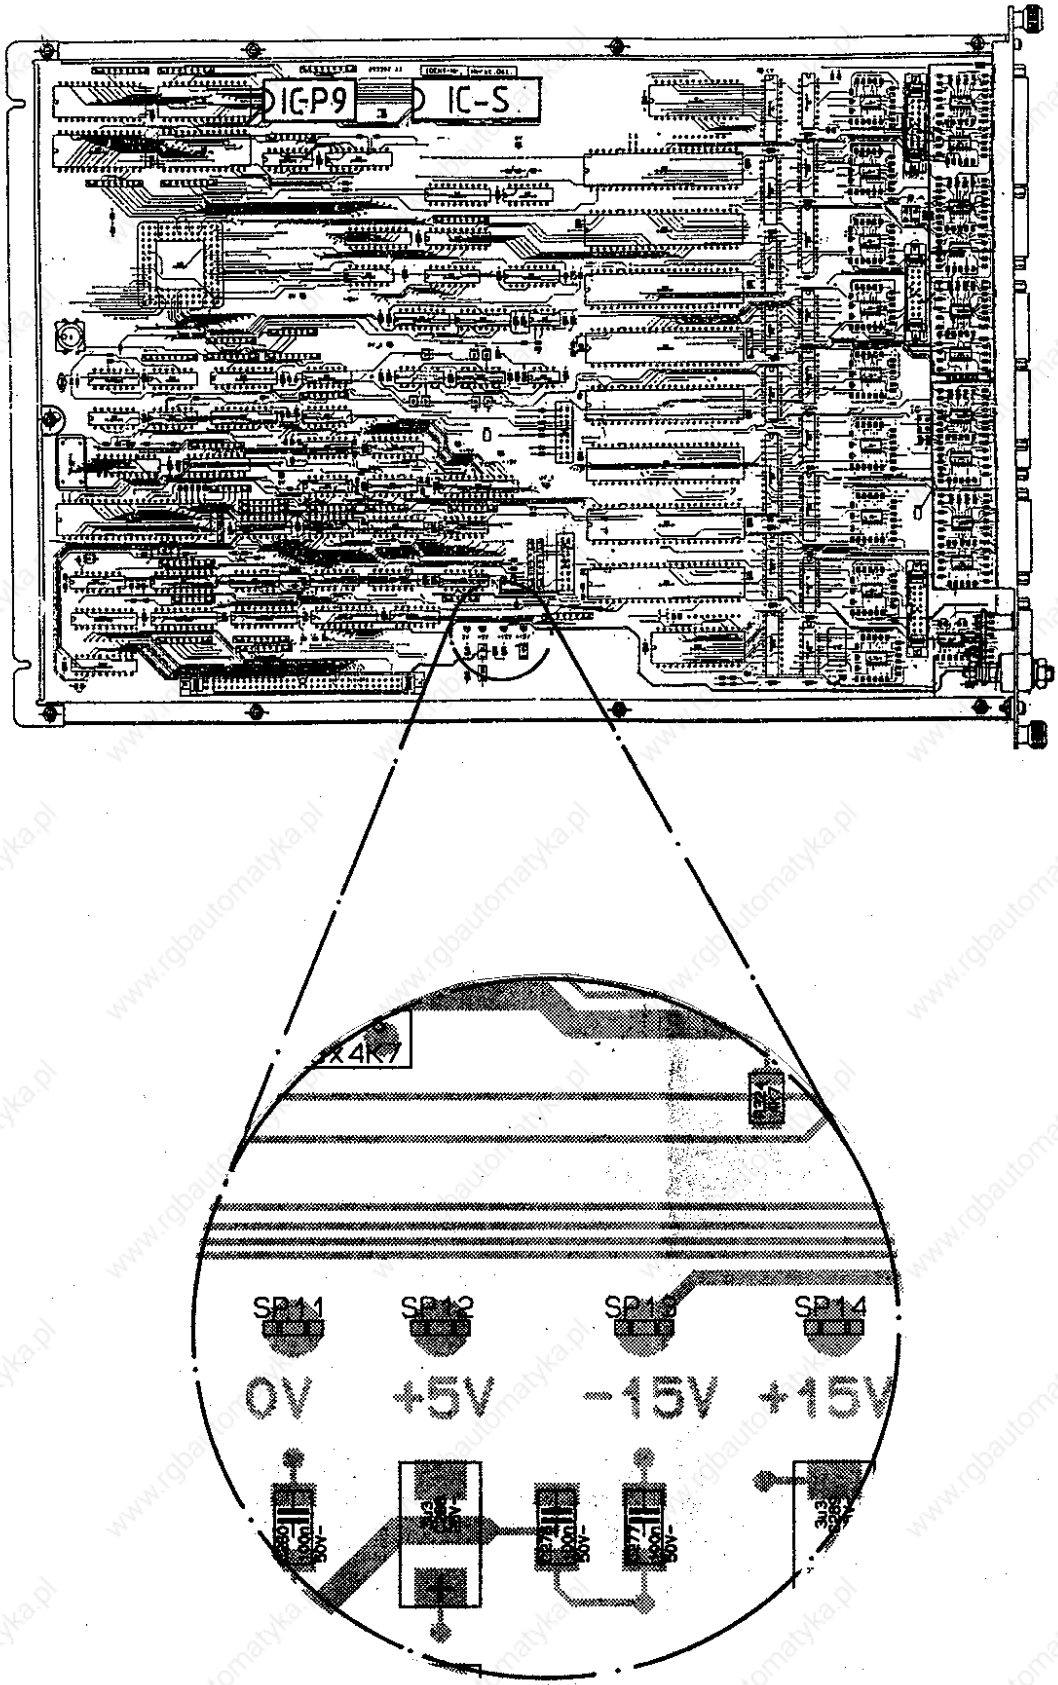
[2] reset U_{Lmax} = 0.4 V, U_{Hmin} = 3.9 V

10.3.2 Test Points on the Boards

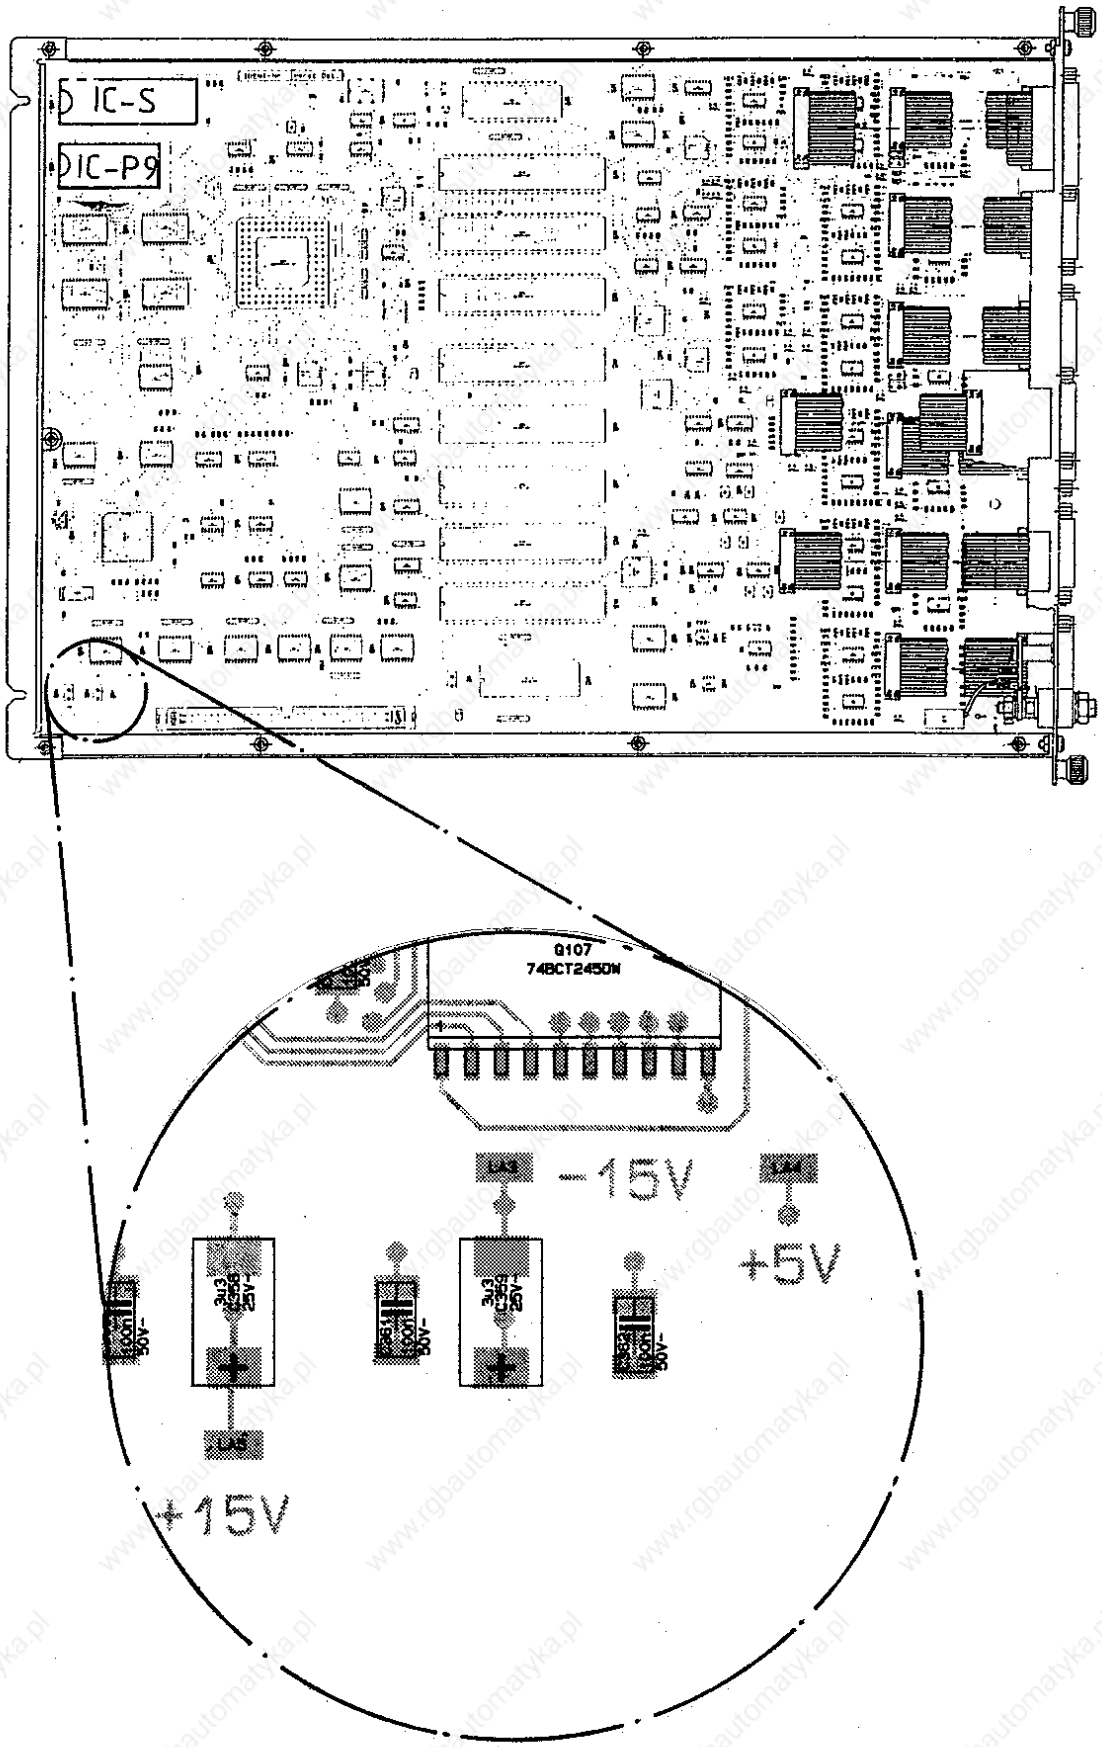
Processor board TNC 415B/425 Id.No. 268 553 –



CLP board TNC 425 Id.No. 265 401 – and Id.No. 268 927 –



CLP Board TNC 415B/425 Id.No. 275 705 -- and Id.No. 275 911 --



10.4 Power Supply of the PLC

The power supply line for the internal PLC of LE 415B/425 is connected to the terminal strip X44.

X44 PLC power supply of LE 415B/425

Terminal strip (pluggable) 3-pin

Pin No.	**Assignment**
1	+ 24 V_A, can be switched off via EMERGENCY STOP
2	+ 24 V , cannot be switched off via EMERGENCY STOP
3	0V

Fuses: F1: 3.15A (+ 24V_A, can be switched off)
F2: 1.0A (+ 24V, cannot be switched off)

The PLC power supply of PL 400, PL 405, PL 410 or PA 110 is connected to the following terminal strips:

Power supply of PA 110

Pin No.	**Assignment**
1	+ 24 V - can be switched off via EMERGENCY STOP
2	0V

Power supply of PL 400

Terminal	**Assignment**
X13	+ 24 V can be switched off via EMERGENCY STOP
X12	0V

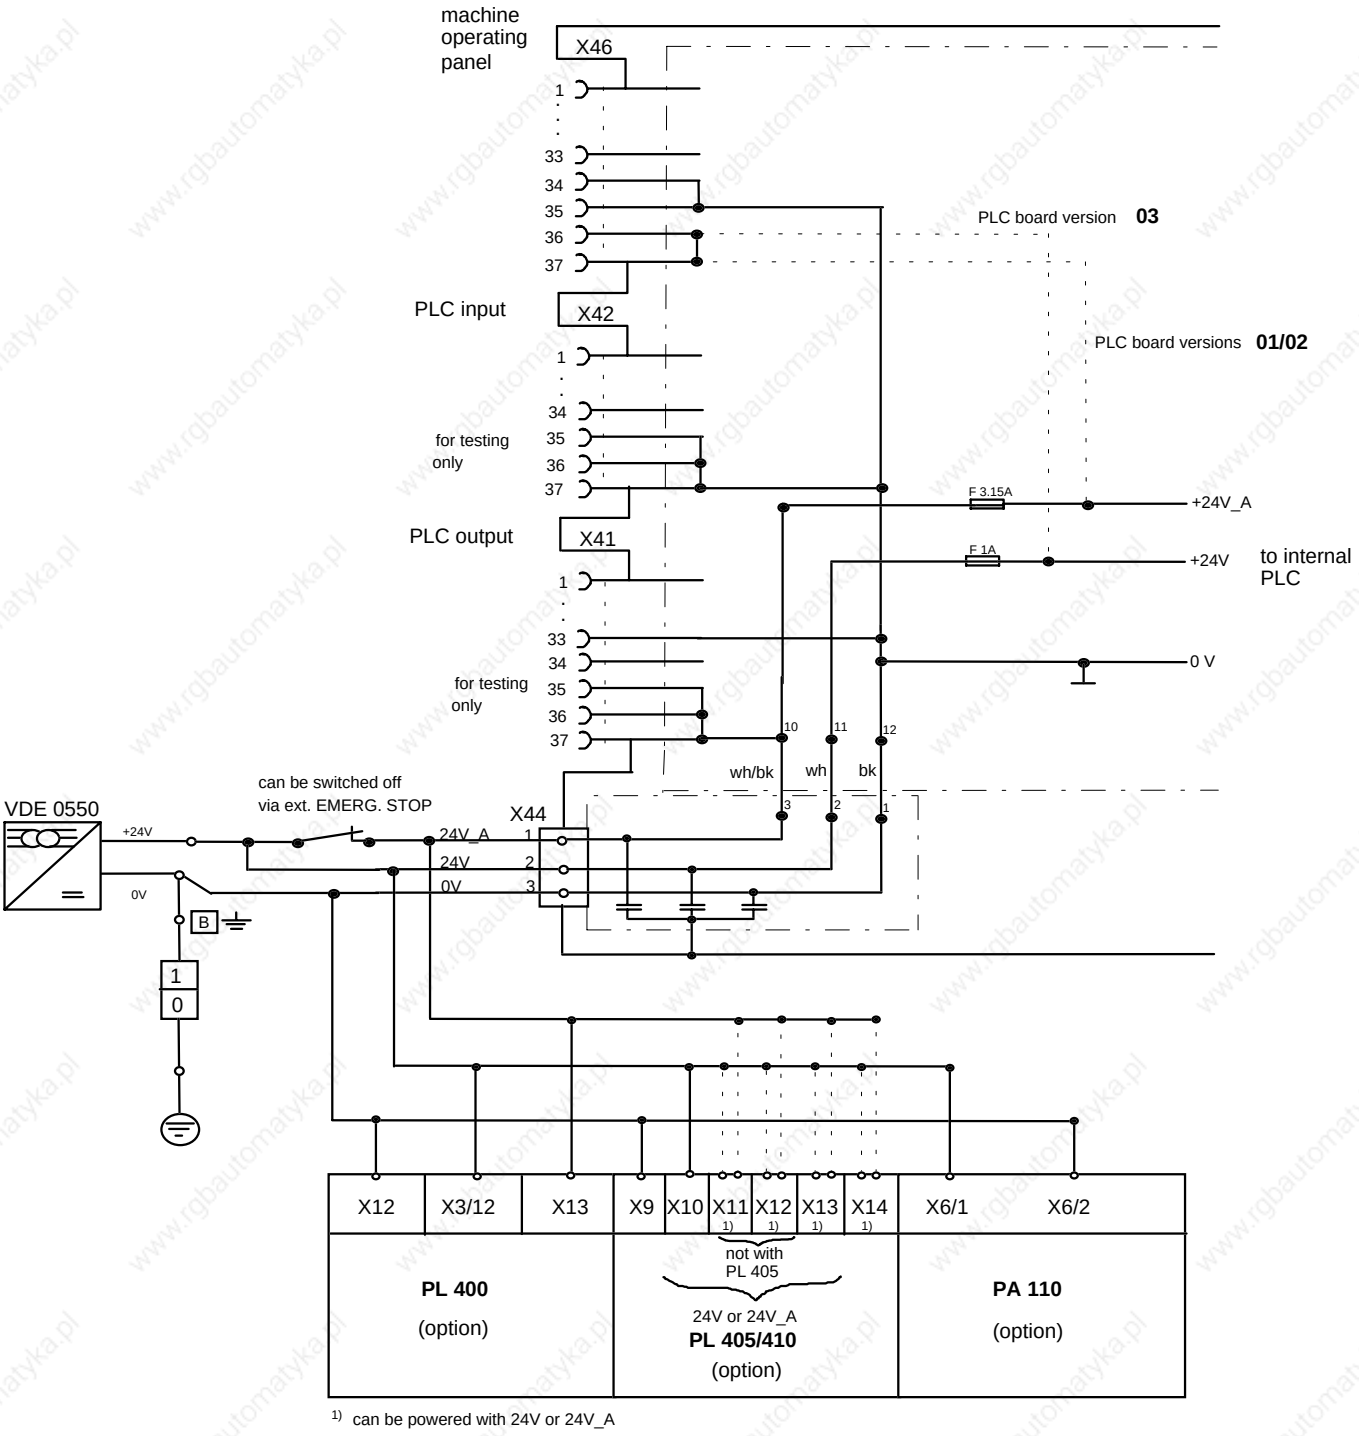
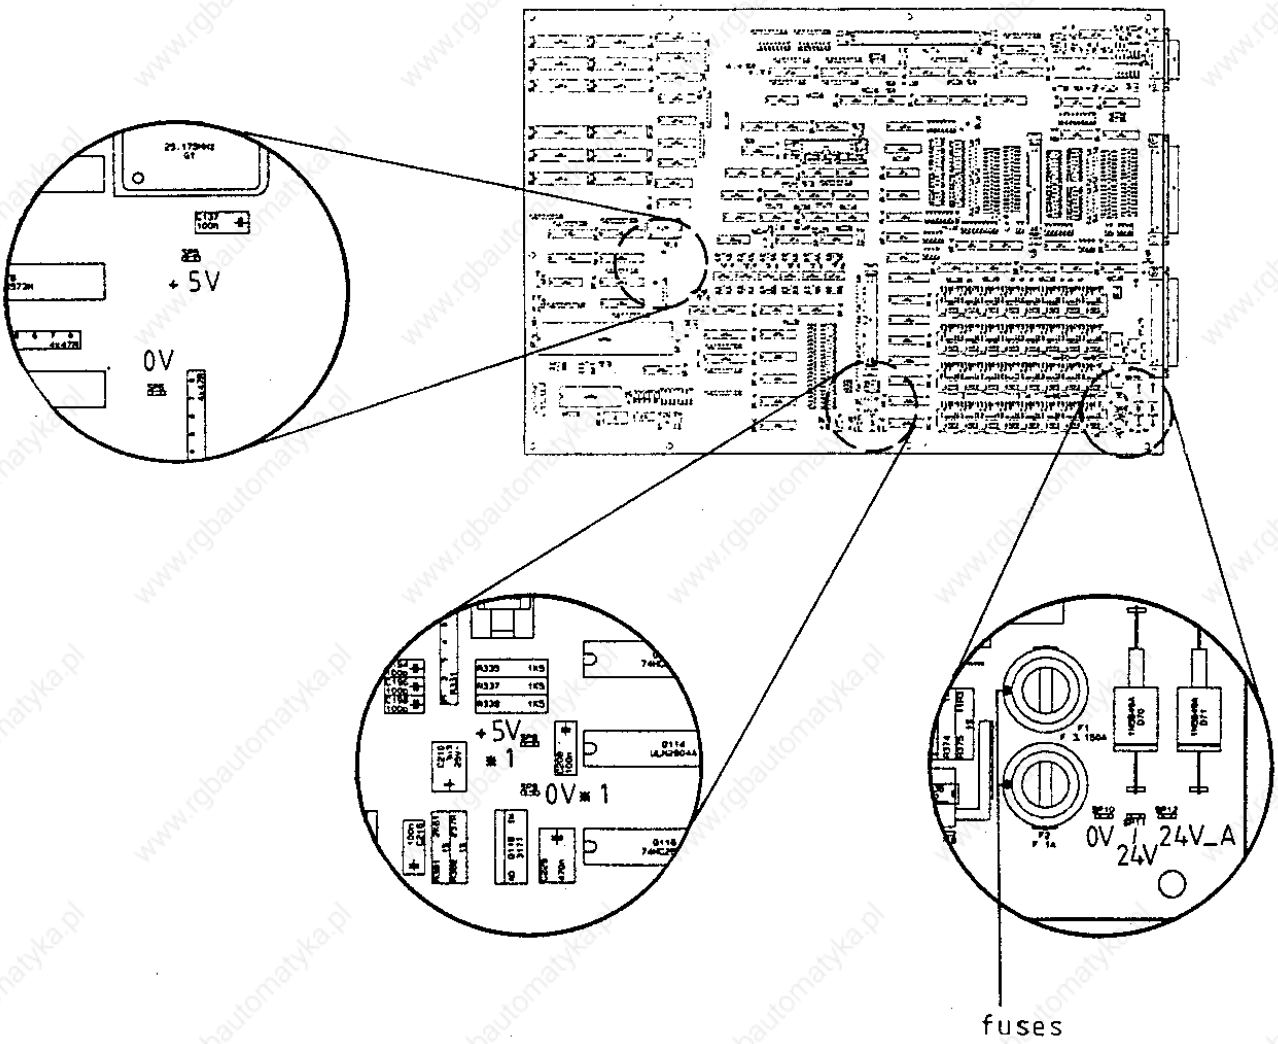
[1)] not with PL 405

10.4.1 PLC Power Supply: Block Diagram



X44 Pin 1, +24V_A (PLC can be switched off): power supply for the PLC outputs O0 - O23.
X44 Pin 2, +24V (PLC cannot be switched off): power supply for the PLC outputs O24 - O30 and output "control ready for operation"; power supply for PLC graphics board.

10.4.2 Test Points on the PLC Graphics Boar



10.5 Buffer Battery

The buffer battery is the voltage source for the program memory when the machine tool is switched off.

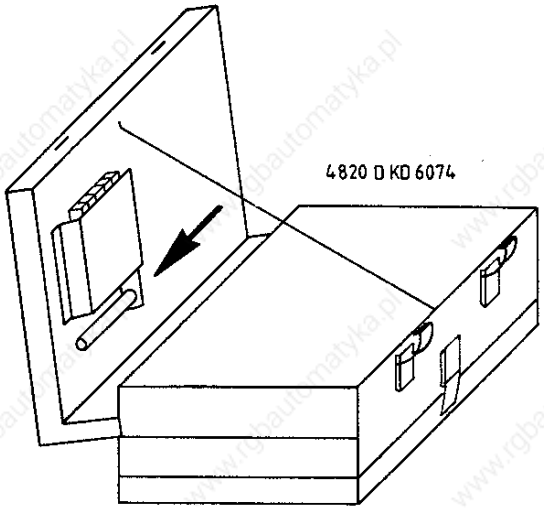
If the error message

EXCHANGE BUFFER BATTERY

is generated, the batteries must be exchanged within one week.

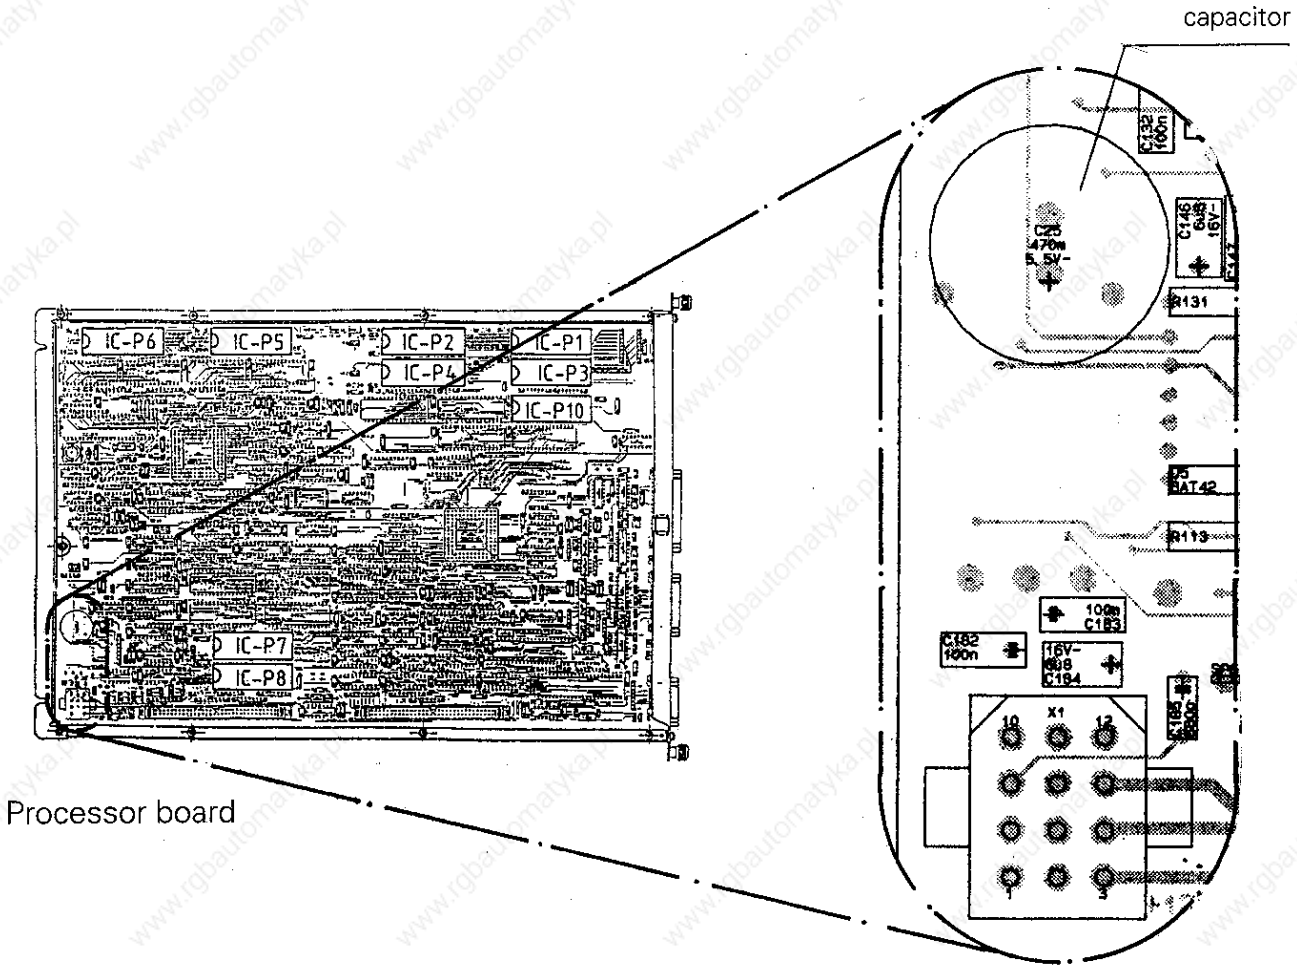
The buffer batteries are located behind a screw fitting in the power supply of the LE. To exchange the batteries, open the LE by undoing the snaps.

In order to protect the program memory of TNC 415B/425, a capacitor (on the processor board) is used in addition to the batteries. Thus, the line voltage may be switched off during battery exchange.
Without the batteries the capacitor is capable of maintaining the memory contents for about one day.



3 AA-size batteries
leak-proof
IEC designation "LR6"

The capacitor is only being charged when the TNC is switched on.



Processor board

11.2 Checking the Keyboard Unit

The keyboard unit can be checked fast and reliably with the measuring adapter.

11.2.1 Checking the Key Functions

Proceeding:

Observe the safety instructions!

- Switch off the main switch.
- Disconnect the keyboard unit from the LE and connect the measuring adapter (see section 20) to the keyboard unit.
  Now the contacts of the keys can be measured at the measuring adapter with an Ohmmeter.

If e.g. PGM NR is pressed at the TNC operating panel, approx. 1 Ω can be measured at the adapter between PIN 8 and PIN 24 (see key matrix, section 11.2.3 and 11.2.4); consider the resistance of the testing wires.

11.2.2 Measuring Setup for Checking the Functions of the NC-Keys

X2: connector for cable keyboard unit ⇨ logic unit (D-SUB, 37-pin)

SK = **s**oft **k**ey (SK1...SK8 from left to right)

11.2.5 Checking the Potentiometers

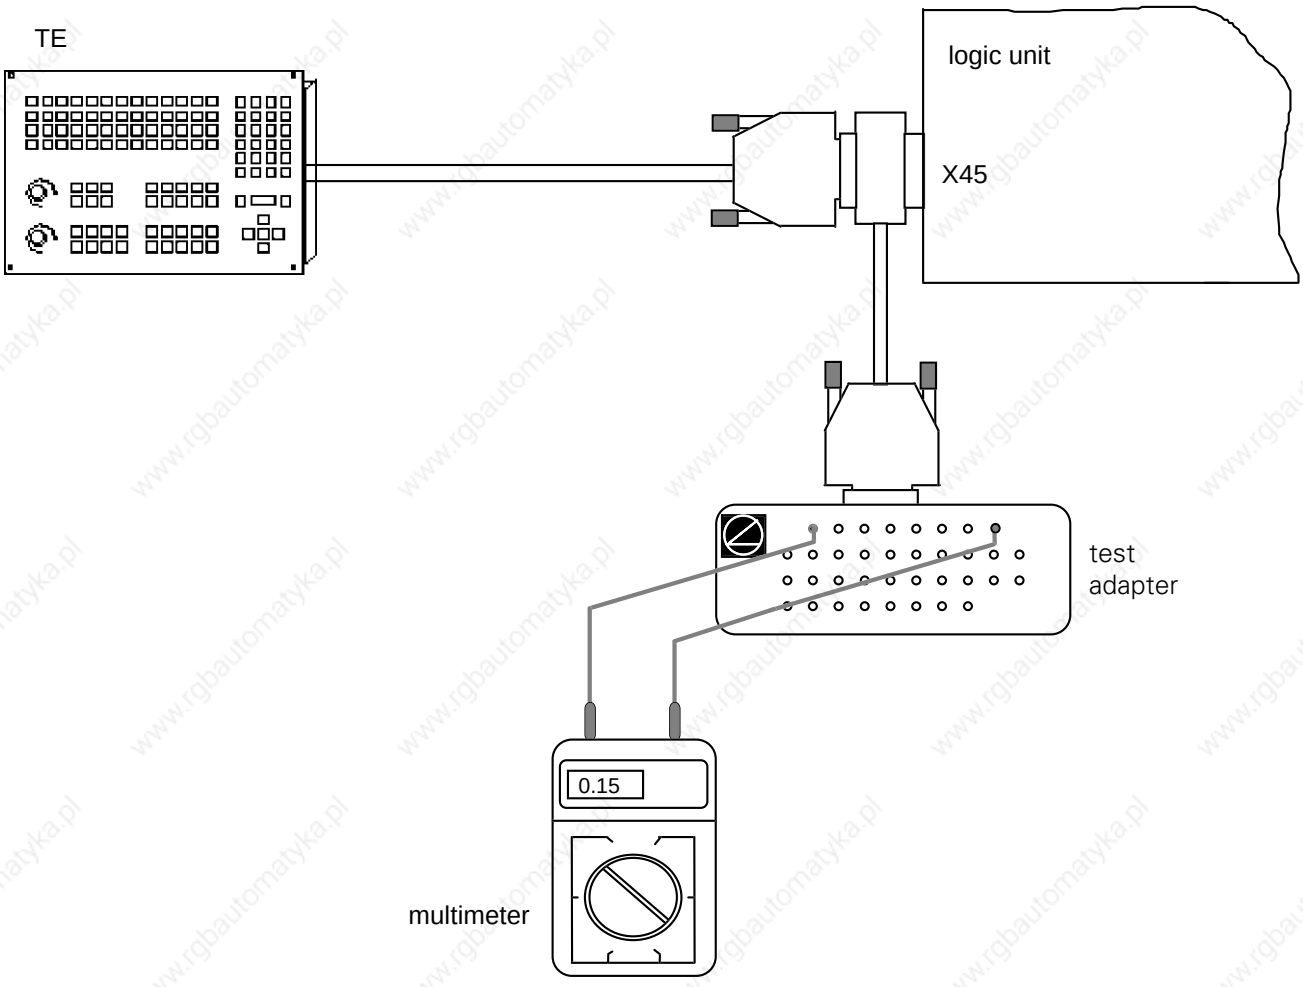
Proceeding:

Observe the safety instructions!

Connect the measuring adapter to X45 of the logic unit. Now the wiper voltages of the potentiometers can be measured with a multimeter.

Potentiometer	PIN	Voltage
override F%	37 = 0V / 35 = + pot.	(0 to approx. 4.95)V
spindle S%	37 = 0V / 34 = + pot.	(0 to approx. 4.95)V

11.2.6 Measuring Setup for Checking the Potentiometers



11.2.7 Machine Operating Panel of TE 410

The PLC inputs of the machine operating panel of TE 410 (I128 - I148) can be tested at the flange socket X3 (37-pin) on the keyboard unit TE 410 or at the flange socket X46 (connection of machine control panel) of the TNC 415B/425.

For this purpose the TABLE function (see section 19.4) in the PLC mode is helpful as well.

KEY of version		Flange socket X3 on KEYBOARD UNIT		PLC

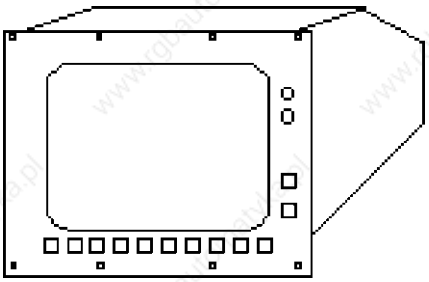
12. Visual Display Unit BC 110/B

12.1 Overview

BC 110 Id.No. 254 740 01

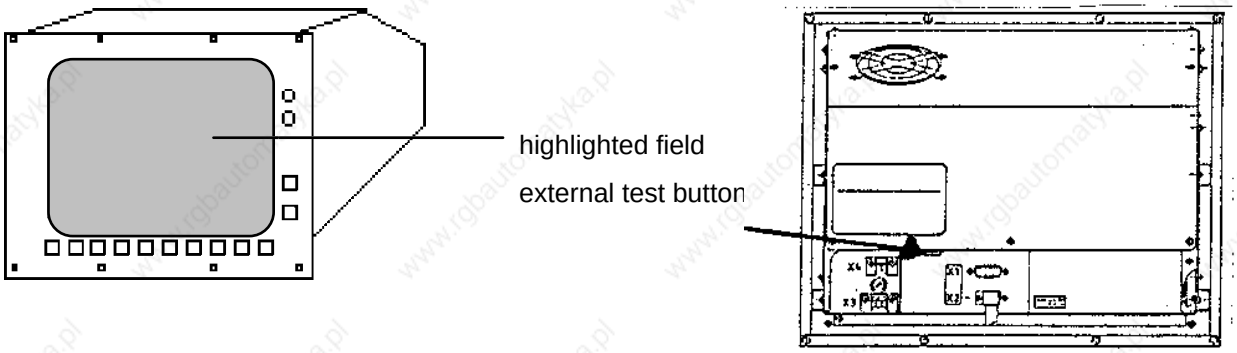
BC 110 B Id.No. 260 520 01



12.2 Checking the Visual Display Unit

BC 110 B, Id.No. 260 520 01

If the screen remains dark when the machine is switched on, first check the power supply (line voltage) of the VDU. If the voltage supply is functioning properly, a square highlighted filed can be generated on the screen of the VDU (which must be switched on) by pressing the external test button on the back side of the unit.



If the VDU generates this highlighted field, the PLC graphics board in the logic unit is probably defective. If however, the VDU remains dark after the test button was pressed, the VDU is defective and must be exchanged.

BC 110, Id.No. 254 740 01

If the screen remains dark when the machine is switched on, first check the power supply (line voltage) of the VDU. The control signals for the screen can only be checked with an oscilloscope.

The following diagrams were generated with the VISUAL DISPLAY UNIT connected. Depending on machine parameters and image depicted, the colour signals R-analog, Y-analog and B-analog may differ from those on page 75.

X43 Visual Display Unit (BC 110)

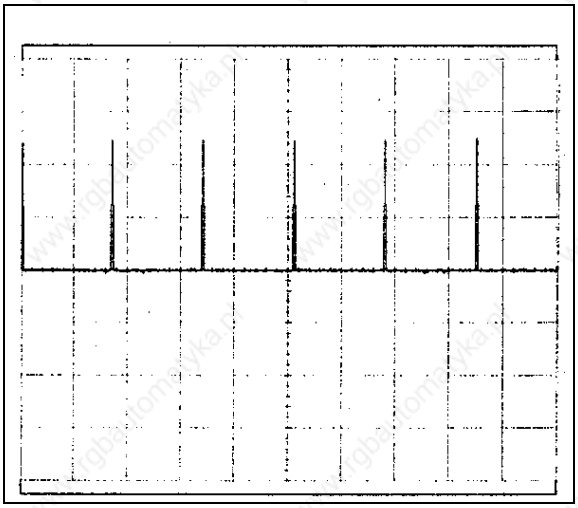
flange socket with female insert (15-pin)

Pin No.	Assignment
1, 8, 11	GND
2 to 6, 12, 13	do not assign
7	R signal
9	V SYNC
10	H SYNC
14	Y signal
15	B signal

Diagrams

V-SYNC PIN 9

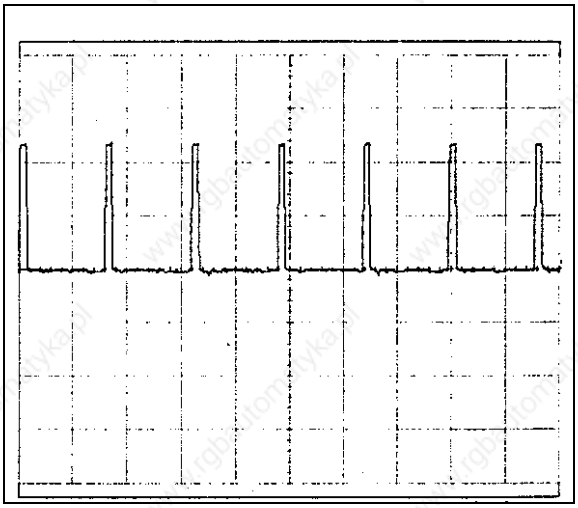
2V/DIV



10 ms/DIV

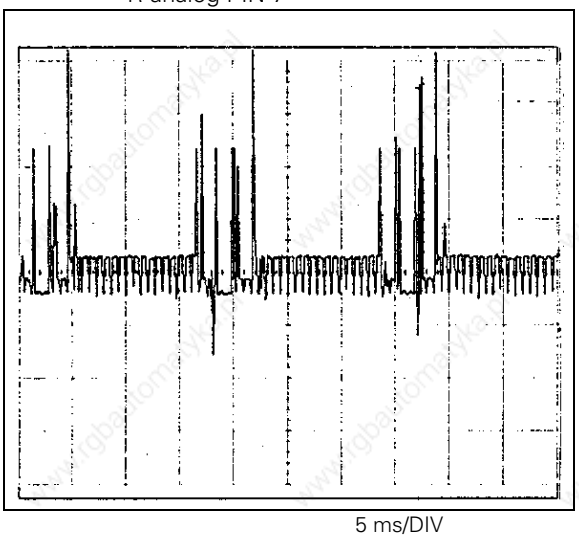
H-SYNC PIN 10

2V/DIV

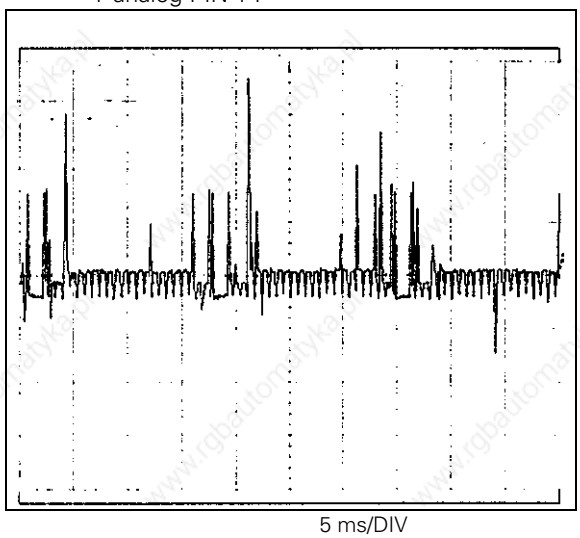


20 µs/DIV

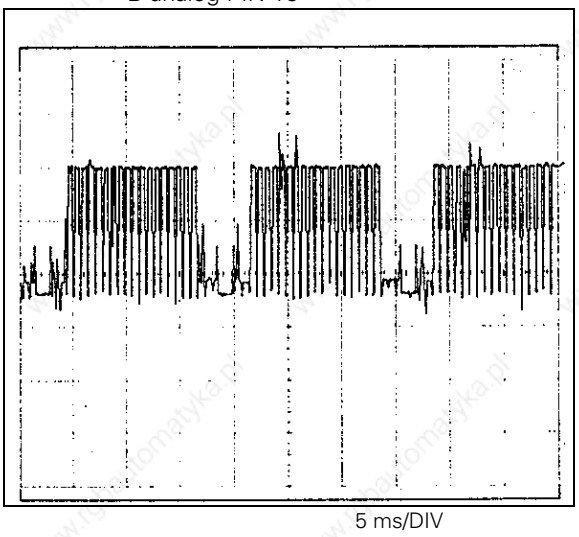
R-analog PIN 7 [1)]



Y-analog PIN 14 [1)]



B-analog PIN 15 [1)]



[1] When measuring the colour signals directly at the output of the logic unit (without the VISUAL DISPLAY UNIT connected), the amplitudes are twice as large.

13. Encoders

13.1 Error Messages for Axes with Analogue Speed Controller

ENCODER <AXIS> DEFECTIVE YA

A = signal amplitude error

ENCODER <AXIS> DEFECTIVE YB

B = signal frequency error

ENCODER <AXIS> DEFECTIVE YC

C = error with distance-coded scales

Y = CPU number
1 = main processor
2 = geometry processor
3 = CLP processor

13.1.1 Error Causes

- Glass scale contaminated or damaged
- Scanning head contaminated or defective
- Cable damaged
- Encoder input of the logic unit (LE) defective

13.1.2 Error Location

In order to determine whether the encoder or the encoder input of the logic unit is defective, the encoders can be switched at the logic unit. For this purpose the corresponding machine parameters must be altered as well:

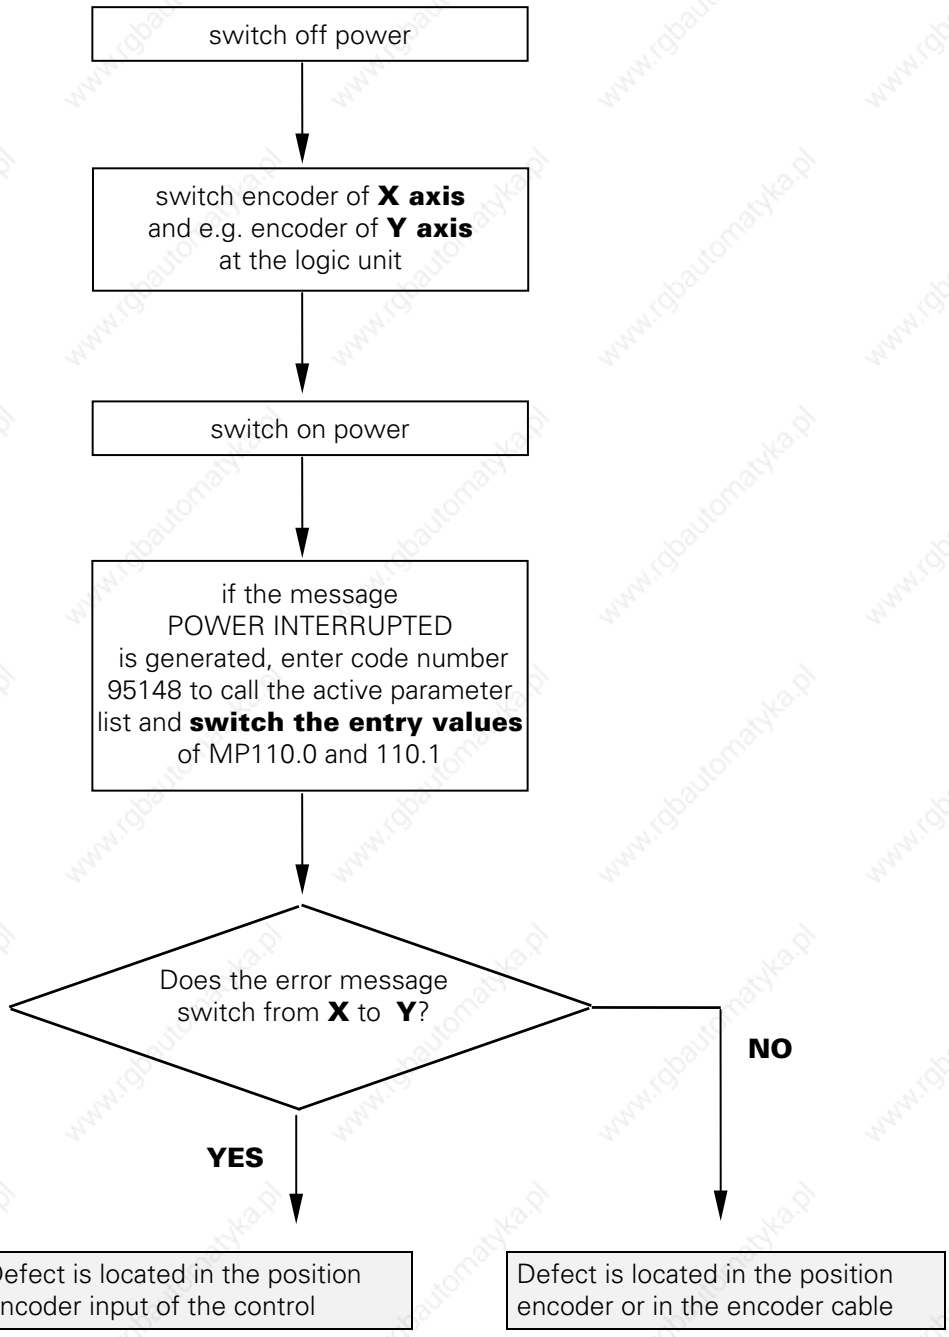
Function		MP	Entry Value
Allocation of the axes	X	110.0	0 = X1
to the encoder inputs	Y	110.1	1 = X2
	Z	110.2	2 = X3
	IV	110.3	3 = X4
	V	110.4	4 = X5
			5 = X6[1)]

[1)] X6 may be used for a machine axis, if no oriented spindle stop is required.

Flow-Chart for Error Location

ENCODER X DEFECTIVE 3B

(Example)



Observe the safety instructions!

13.2 Error Messages for Axes with Integral Digital Speed Controller

With the integral digital speed controller there are **two** encoder inputs for each axis:

Encoder inputs for the actual position:		**Encoder inputs for the actual speed:**	
encoder 1:	input X1	encoder 1:	input X15
encoder 2:	input X2	encoder 2:	input X16
encoder 3:	input X3	encoder 3:	input X17
encoder 4:	input X4	encoder 4:	input X18
encoder 5:	input X5	encoder 5:	input X19
encoder S:	input X6		

Therefore, there are **two** groups of error messages:

Monitoring of actual position capture (X1, X2, X3, X4, X5, X6)

ENCODER <AXIS> DEFECTIVE YA

A = signal amplitude error, position encoder

ENCODER <AXIS> DEFECTIVE YB

B = signal frequency error, position encoder

ENCODER <AXIS> DEFECTIVE YC

C = error with distance-coded scales, position encoder

Y = CPU number
1 = main processor
2 = geometry processor
3 = CLP processor

Monitoring of actual speed capture (X15, X16, X17, X18, X19)

ENCODER <AXIS>` DEFECTIVE YA

A = signal amplitude error, speed encoder

ENCODER <AXIS>` DEFECTIVE YB

B = signal frequency error, speed encoder

ENCODER <AXIS>` DEFECTIVE YC

C = error with distance-coded scales (speed encoder)

Y = CPU number
1 = main processor
2 = geometry processor
3 = CLP processor

13.2.1 Error Causes

- Glass scale contaminated or damaged
- Scanning head contaminated or defective
- Cable damaged
- Encoder input of the logic unit (LE) defective

13.2.2 Error Location

In order to determine whether the one of the encoders of an axis or one of the encoder inputs on the logic unit is defective, the encoders can be switched at the logic unit. For this purpose the corresponding machine parameters must be altered as well (always change **both** parameters!):

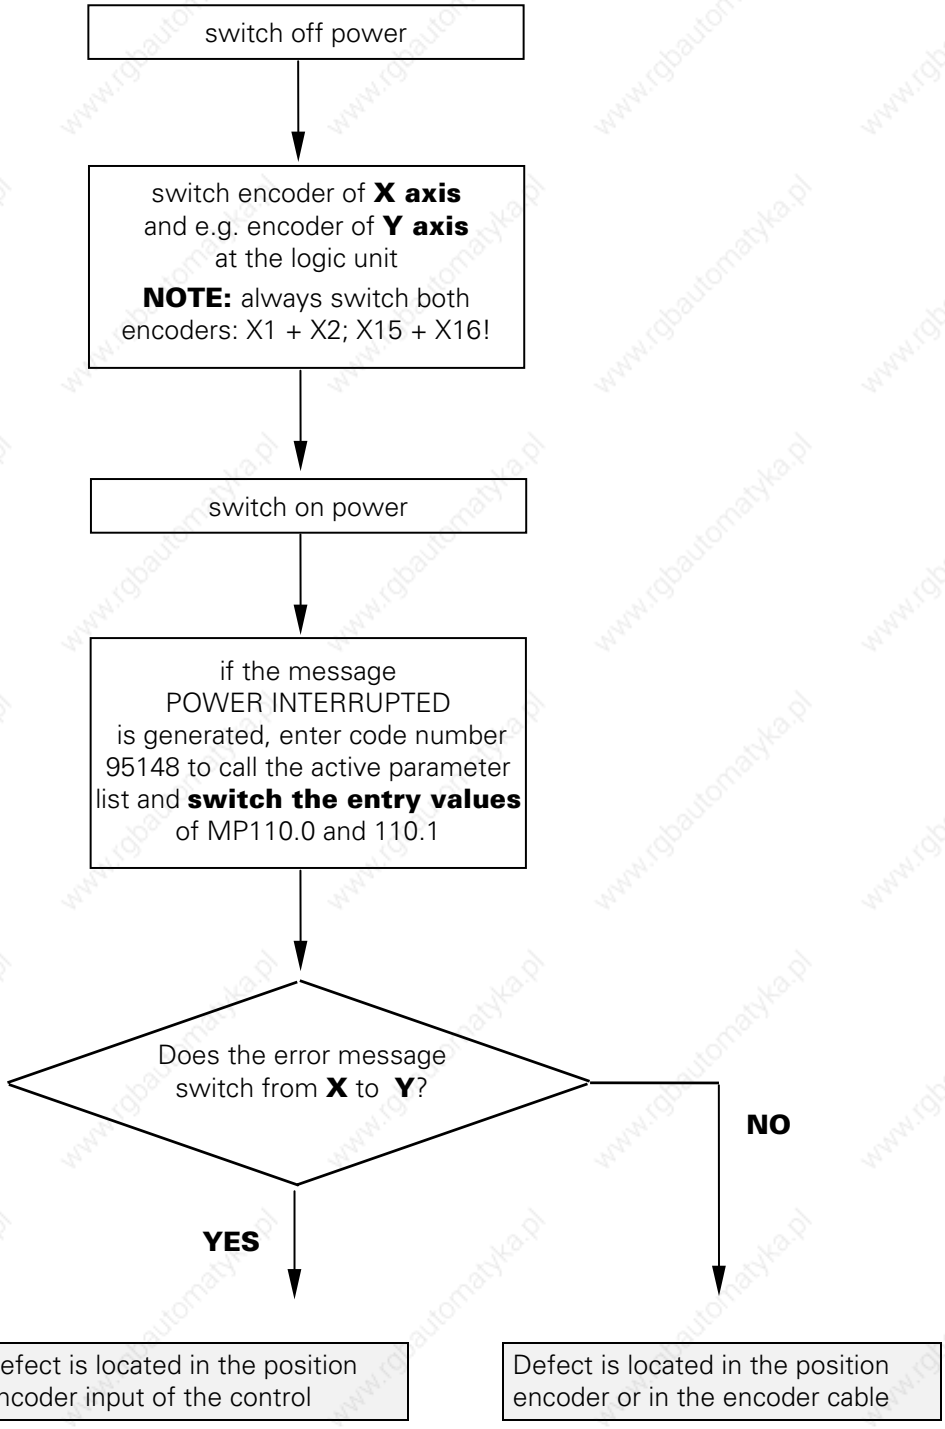
Function		**MP**	**Entry value**
Allocation of the axes	X	110.0	0 = X1 (pos.) / X15 (speed)
to the encoder inputs	Y	110.1	1 = X2 (pos.) / X16 (speed)
	Z	110.2	2 = X3 (pos.) / X17 (speed)
	IV	110.3	3 = X4 (pos.) / X18 (speed)
	V	110.4	4 = X5 (pos.) / X19 (speed)
			5 = X6[1] (pos.)

[1] X6 can be used for a machine axis, if no oriented spindle stop is required.

Flow-Chart for Error Location

ENCODER X` DEFECTIVE 3B

(Example)



Observe the safety instructions!

13.3 Electrical Inspection of an Encoder

In order to give a precise statement on the electrical function of an encoder, it must be measured with a phase angle measuring unit (PWM), an oscilloscope and a leak tester. (see operating instructions of encoder diagnostic set)

If no phase angle measuring unit is available, the electrical state of the cable, the lamp and the photocells of an encoder can be checked with an ohmmeter. The following resistances must be measured at the connector of the encoder:

Possible measurements at an encoder with current interface (7 - 16µA)

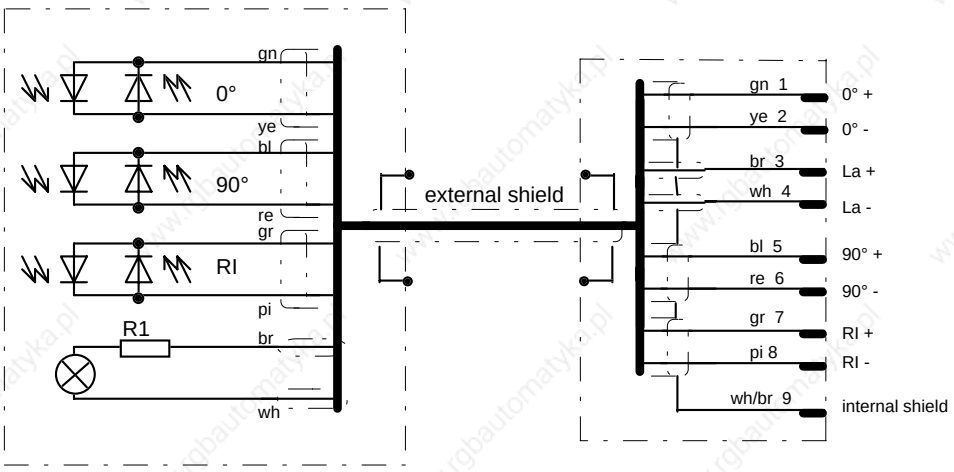
- encoder connector housing against machine chassis < 1 Ω (external shield)
- encoder connector housing against PIN 9 (internal shield - external shield) R = ∞
- encoder connector housing against PIN 1 to PIN 8 (external shield - signal lines) R = ∞
- PIN 9 against PIN 1 to PIN 8 (internal shield - signal line) R = ∞

• pin 1 against pin 2	0°		
• pin 2 against pin 1	0°	(switch poles of ohmmeter)	
• pin 5 against pin 6	90°		The measured values should approximately equal.
• pin 6 against pin 5	90°	(switch poles of ohmmeter)	
• pin 7 against pin 8	RP[1]		
• pin 8 against pin 7	RP[1]	(switch poles of ohmmeter)	
• pin 3 against pin 4[2]		(approx. 5 - 30 Ω)	

1) If encoders with selectable reference mark are used, different resistance values can be measured (or no resistance), depending on the type of activation.

2) The encoder check (pin 3 against pin 4) can only be carried out, if the encoder light unit is a lamp. If the encoder features an amplifier section, the light unit cannot be checked at all. With encoders with infrared diodes, a resistance in the conducting direction can be measured between pin 3 (+) and pin 4 (-).

Basic Circuit Diagram with Sinusoidal Signals (7 - 16µA)



Encoders with square-wave signals can only be tested with a phase angle measuring unit (PWM).

14. Electronic Handwheels

14.1 Handwheel HR 130/330

HR 130 Id.No. 254 040 --
HR 130.001 Id.No. 249 371 --

HR 330
Id.No. 251 534 --

Adapter cable for HR 330
Id.No. 249 889 --

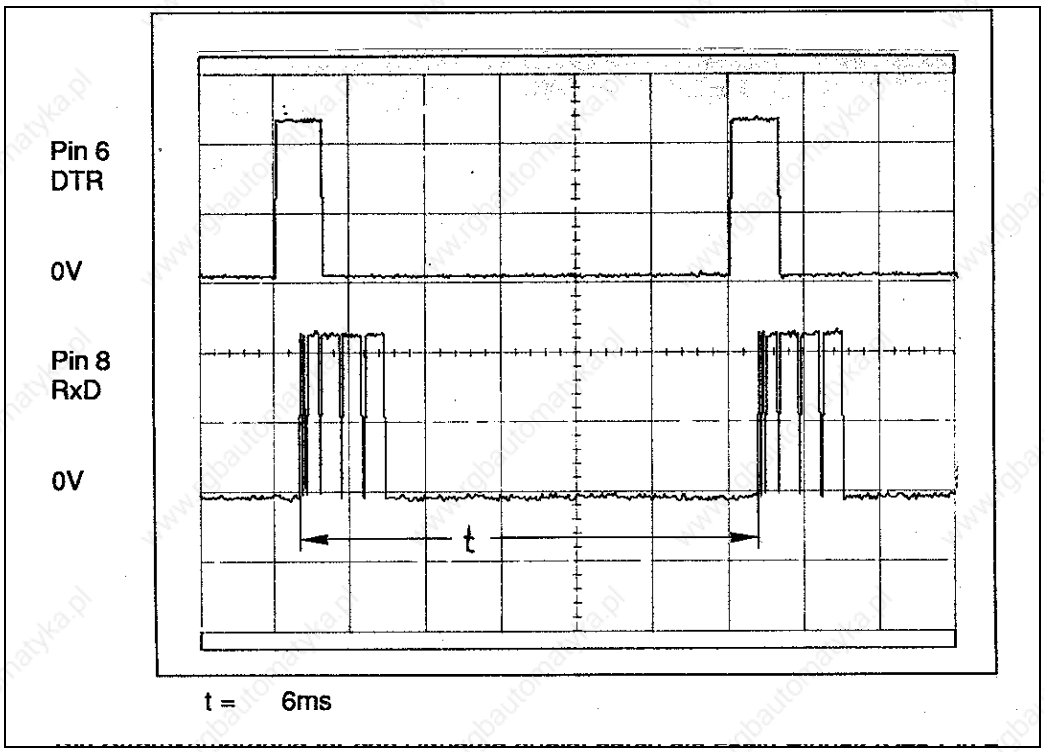
4	ye	DTR
5	bn	+12V
6	wh	0V

pin	color	signal
2	wh	0V
4	bn	+12V
6	ye	DTR
8	gn	RxD

14.1.1 Checking the Handwheel HR 130/330

The serial handwheel HR 130 (without auxiliary keys) and HR 330 (with auxiliary keys) can be checked with an oscilloscope. The following signals can be measured at the handwheel input X23 of LE 415B/425. The signals have to correspond to the diagram below.



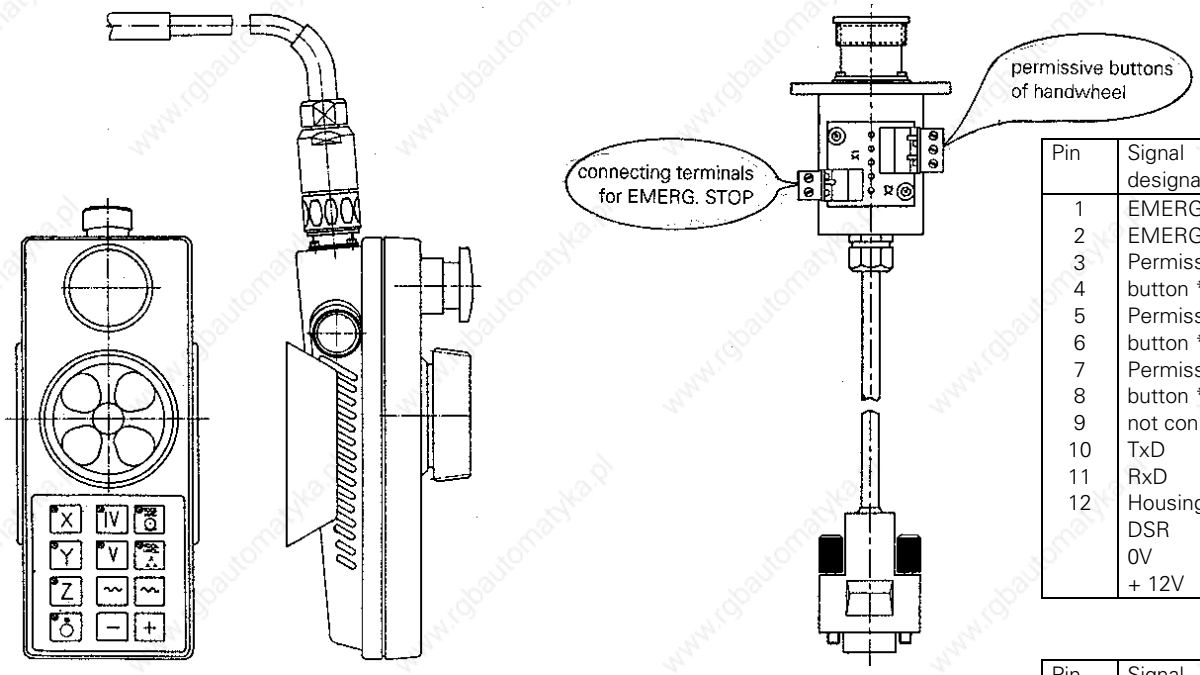
The supply voltage for the handwheel is fed via the logic unit (X23 pin 2 = 0V, pin 4 = + 12V).

14.2 Handwheel HR 332

HR 332 Id.No. 266 064 –

Connecting cable Id.No. 272 292 –

Adapter cable Id.No. 274 556 01
(12-pin to 9-pin)



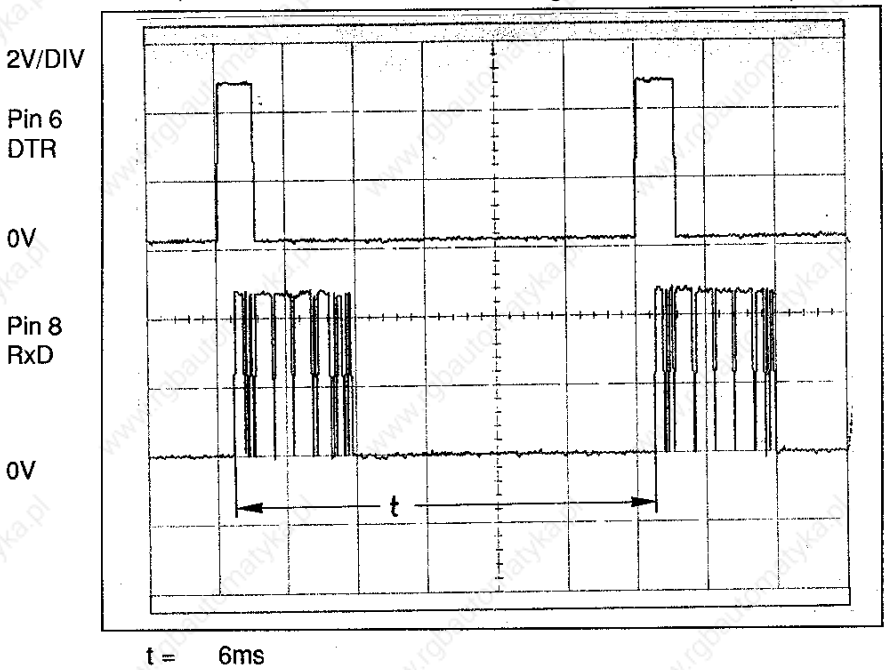
Pin	Signal designation
1	EMERG. STOP
2	EMERG. STOP
3	Permissive
4	button *
5	Permissive
6	button *
7	Permissive
8	button *
9	not connected
10	TxD
11	RxD
12	Housing shield
	DSR
	0V
	+ 12V

Pin	Signal designation
2	0V
4	+ 12V
6	DTR
7	TxD
8	RxD

The assignment of the handwheel keys depends on the version.
* The number of the permissive buttons and the internal wiring depends on the version of HR 332.

14.2.1 Checking the Handwheel HR 332

The serial handwheel HR 332 can be checked with an oscilloscope. The following signals can be measured at the handwheel input X23 of LE 415B/425. The signals have to correspond to the diagram below.



t = 6ms

The supply voltage for the handwheel is fed via the logic unit (X23 pin 2 = 0V, pin 4 = + 12V).

14.3 Error Messages

HANDWHEEL ?

- Data transfer (cable) has been interrupted
- Incorrect value entered in MP 7640.

HANDWHEEL DEFECTIVE

The light unit in the electronic handwheel is not emitting enough light, with the result that the signals in the handwheel become too small. An error signal is sent over the serial interface of the handwheel.

15. 3D-Touch Probes

15.1 Overview

15.1.1 Touch Probes with External Interface Electronics (APE)

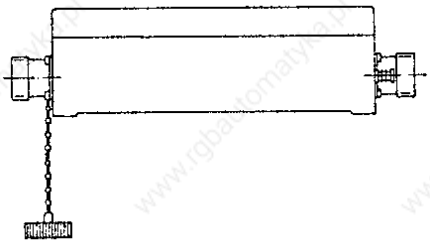
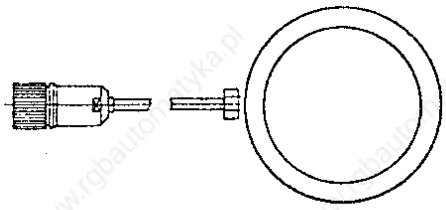
APE 511 Id.No. 237 586 -- for **TS 511**
with additional connector for a second **SE 510**

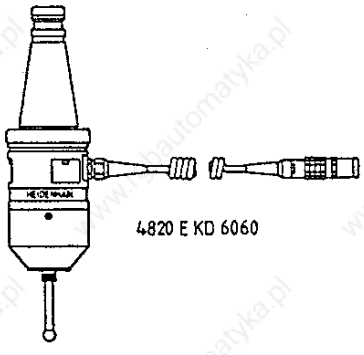


SE 510 Id.No. 230 473 --

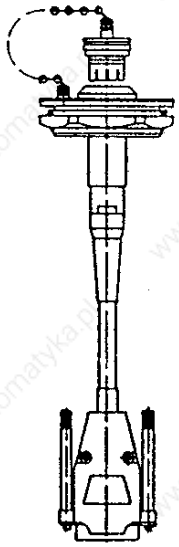


15.1.2 Touch Probe with Integral Interface Electronics (APE)

TS 120 Id.No. 243 614 --



Adapter cable for TS 120 Id.No. 244 891 --



15.2 Error Messages

15.2.1 Error Messages in the Probing Mode

TOUCH POINT INACCESSIBLE

- After the start of a probing function, the scanning point was not reached within the measuring range defined in the machine parameter MP6130.

EXCHANGE TOUCH PROBE BATTERY

- The battery voltage of the touch probe system with infrared transmission is below the minimum value.

STYLUS ALREADY IN CONTACT

- The stylus was already deflected when the probing function was started.

PROBE SYSTEM NOT READY

- The infrared transmission between the "Touch Probe" and the "Transmitter/Receiver Unit" is faulty (e.g. caused by contamination) or interrupted. The two windows of the touch probe system must be oriented to the transmitter/receiver unit.
- The battery is dead.
- The TM 110 is not connected.
- An error has been detected at one of the encoders of the TM110 (contamination).

15.2.2 Error Messages during Digitizing of 3D-Contours

WRONG AXIS PROGRAMMED

- The touch probe axis in the scanning cycle **RANGE** is not identical with the calibrated touch probe axis.

FAULTY RANGE DATA

- A MIN coordinate value in the scanning cycle **RANGE** is larger than or equal to the corresponding MAX coordinate value.
- One or more coordinates are beyond the limit switch range of the scanning cycle **RANGE**.
- No scanning cycle **RANGE** was defined when calling the scanning cycles **MEANDER** or **CONTOUR LINES**.

MIRRORING NOT PERMITTED

ROTATION NOT PERMITTED

SCALING FACTOR NOT PERMITTED

- Mirroring, rotation or scaling factor were active when the scanning cycles **RANGE**, **MEANDER** or **CONTOUR LINES** were called.

RANGE EXCEEDED

- The range has been exceeded during probing, i.e. a part of the 3D-contour is outside the range.

CYCL PARAMETER INCORRECT

- The programmed travel or the distance between lines or points is negative or larger than 56 535 mm. (only possible with Q-parameter programming)

TOUCH POINT INACCESSIBLE

- The stylus was deflected before the range was reached during approach.
- In the cycle CONTOUR LINES, the stylus was not deflected within the probing range.

STYLUS ALREADY IN CONTACT

- The stylus is not at rest, although it is not touching the contour.

PLANE WRONGLY DEFINED

- One of the coordinates of the starting point in the cycle CONTOUR LINES is identical with the touch probe axis.

START POSITION INCORRECT

- The starting point coordinate that is identical with the starting probe-axis is beyond the range.

AXIS DOUBLE PROGRAMMED

- The same axis has been programmed for both starting point coordinates in the cycle CONTOUR LINES.

TIME LIMIT EXCEEDED

- In the scanning cycle CONTOUR LINES the first point of the scanned line was not reached within the programmed time limit.

STYLUS DEFLECTION EXCEEDS MAX.

- The stylus was deflected by more than the value programmed in the machine parameter MP6330 (TM110).

16. Data Interfaces

16.1 Operating Modes of the Data Interfaces

For data transfer the TNC 415B/425 can be switched to the following 6 interface modes:

ME: For connection of the HEIDENHAIN Magnetic Tape Unit ME 101/102 or other peripheral units (e.g. printer).

Data format and protocol adapted to ME!

Protocol:	standard transfer
Data format:	7 data bits, 1 stop bit, even parity
Baud rate:	110 - 2400 Baud
Interface parameter:	fixed
Transmission stop:	DC3 (software handshake)

FE 1: For connection of the HEIDENHAIN Floppy Disk Unit FE 401 B (or the Floppy Disk Unit FE 401, from software 230 626 **03**) or other peripheral units.

Data format and protocol adapted to FE 401/B!

Protocol:	blockwise transfer
Data format:	7 data bits, 1 stop bit, even parity
Baud rate:	110 - 38400 Baud (FE 401B) 9600 Baud (FE 401)
Interface parameter:	fixed
Transmission stop:	DC3 (software handshake)

FE 2: For connection of the HEIDENHAIN Floppy Disk Unit FE 401 or other peripheral units.

Data format and protocol adapted to FE 401/B!

Protocol:	blockwise transfer
Data format:	7 data bits, 1 stop bit, even parity
Baud rate:	110 - 38400 Baud 9600 Baud (FE 401)
Interface parameter:	fixed
Transmission stop:	DC3 (software handshake)

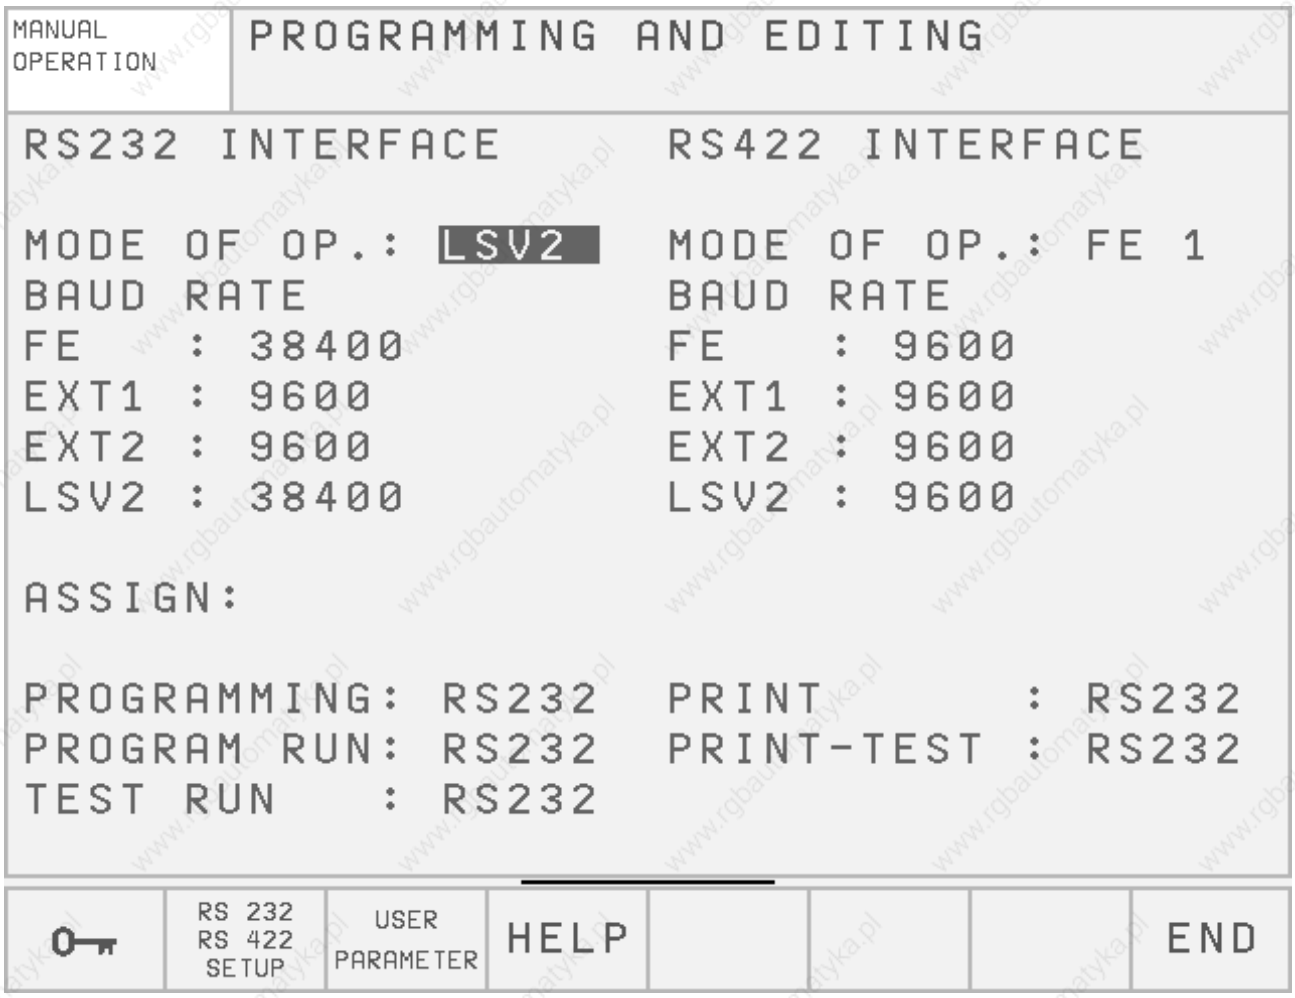
EXT 1: To adapt the transfer of data to external units in standard data format
EXT 2: and for blockwise transfer.

Protocol:	standard or blockwise transfer adaptation from machine parameter MP 5000
Data format:	adaptation from machine parameter MP 5000
Baud rate:	110 - 38400 Baud
Interface parameters :	adaptation from machine parameter MP 5000
Transmission stop:	DC3 (software handshake) or RTS (hardware handshake) selectable as of MP5000

LSV/2: With the LSV/2 protocol several functions (such as file management, remote control and TNC diagnosis from a PC) can be performed with the appropriate software (TNC REMOTE or LSV/2 TOOLBOX).

16.1.1 Interface Configuration and Allocation of the Operating Modes

In the operating modes PROGRAMMING AND EDITING and TEST RUN the setup menu for the data interfaces is called after pressing MOD and the soft key RS 232 RS 422 SETUP.



On the left half of the screen the RS-232-C interface is configured, on the right half the RS-422-C. On the lower left of the screen the operating modes PROGRAMMING/EDITING, PROGRAM RUN and TEST RUN can be allocated to either RS-232-C or RS-422-C. (If the MOD function "RS 232/RS 422 SETUP" is called in the PLC editor or the MP editor, the editor can be allocated to one of the interfaces.)

On the lower right of the screen the user can define via PRINT or PRINT TEST, whether outputs with FN15 and digitized positions are to be output via one of the interfaces or into a file in the memory of the control.

- RS 232 means: Data are output via the data interface RS-232-C.
- RS 422 means: Data are output via the data interface RS-422-C.
- FILE means: Data are filed in the TNC.

Note:
In the machine parameter MP5000 individual interfaces can be disabled.

With the arrow keys  the desired settings

(operating mode, baud rate, interface allocation) can be selected and set according to your requirements by pressing ENT.

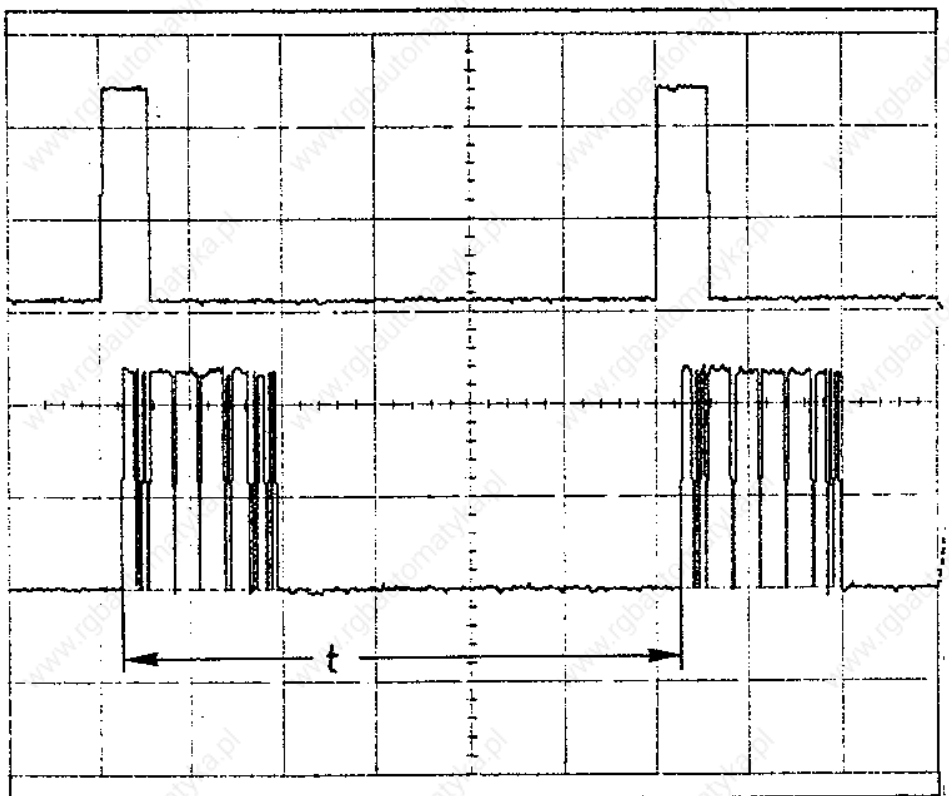
To exit the MOD function RS 232/RS 422 SETUP, press the soft key END.

16.2 Machine Parameters for the Data Interfaces

In the operating modes ME, FE 1, FE 2 and LSV/2 the interface parameters cannot be changed.

In the operating modes EXT 1 and EXT2 the interface parameters can be set via machine parameter (starting with MP5000).

The detailed functions of the individual machine parameters please see from the "Technical Manual" or from the "Description of the Data Interfaces TNC 407/415" (Id.No. 275 931 --).



16.3 Error Messages

16.3.1 Error Messages at the TNC in the ME Mode

WRONG OPERATING MODE

The wrong operating mode or no operating mode was selected on the external data medium.

WRONG PROGRAM DATA

Wrong program data have been detected during data transfer. The control attempted three times to read the data from the magnetic tape before interrupting the process.

DATA MEDIUM MISSING

No cassette has been inserted into the drive.

DATA MEDIUM EMPTY

No programs are stored on the data medium (cassette).

DATA MEDIUM WRITE-PROTECTED

The write-enable plug on the cassette is missing.

PROGRAM INCOMPLETE

Data transfer was interrupted before the program was transferred completely.

EXT. INPUT/OUTPUT NOT READY

The DSR-signal is missing at the TNC.
- ME not connected.
- Defective or wrong transfer cable.
- Wrong interface assignment.

ME: TAPE END

The cassette is full. To continue data transfer, turn over or exchange the cassette.

16.3.2 Error Messages at the ME

In the ME the electronics is tested, and the external operating conditions are checked. If an error is detected, the lamps of the operating mode display start blinking. In the following table the error types are listed:

○ LED off ✸ LED blinking

Indicator Lamp	Error Message
○○○✸ ○○○○	Faulty data during transfer
○○✸○ ○○○○	No cassette inserted
○○✸✸ ○○○○	Write-enable plug in cassette missing
○✸○○ ○○○○	Wrong operating mode selected
○✸○✸ ○○○○	Data of magnetic tape faulty
○✸✸○ ○○○○	Magnetic tape empty
✸○○○ ○○○○	Errors in ME electronics
✸○○✸ ○○○○	
✸○✸○ ○○○○	
✸○✸✸ ○○○○	
✸✸○○ ○○○○	
✸✸○✸ ○○○○	
✸✸✸✸ ○○○○	End of tape
○✸✸✸ ○○○○	Peripheral unit not connected
✸✸✸○ ○○○○	Data transfer between TNC and ME or peripheral unit was interrupted with DEL □

By pressing STOP the error messages can be cleared.

16.3.3 Error Messages at the FE in the ME-Mode

In the ME-mode, errors are displayed by blinking indicator lamps (LEDs).

○ LED off ● LED on ✸ LED blinking

Indicator Lamp	Error Message
○○○● ○✸○○	Disk missing or error in the ME electronics
○○○✸ ○✸○○	Disk cannot be formatted, as it is currently being used
✸○○● ✸○○○	Disk missing or not formatted
✸○○✸ ✸○○○	Disk cannot be copied, as a read/write process is active
●○✸● ○○○○	External unit not ready or not connected
✸○●● ○○○○	Disk missing or not formatted
✸○○● ○○●○	Disk missing or not formatted or no program available
✸○●✸ ○○○○	Program cannot be output, as a transfer is active via the TNC interface
✸○○✸ ○○●○	Program cannot be output, as a transfer is active via the PRT interface
○○✸● ●○○○	External unit not ready or not connected
○○●● ✸○○○	Disk missing or not formatted
○○○● ✸○●○	Disk missing or not formatted
○○●✸ ✸○○○	Program cannot be output, as a transfer is active via the TNC interface
○○○✸ ✸○●○	Program cannot be output, as a transfer is active via the PRT interface
○●○● ○○✸○	External unit not ready or not connected
○✸○● ○○●○	Disk missing or error in the ME electronics
○✸○✸ ○○●○	Table of contents cannot be output, as a transfer is active via the PRT interface
○○○✸ ○○●○	No interface coupling possible, as a transfer is active via the TNC interface
○○●✸ ○○○○	No interface coupling possible, as a transfer is active via the PRT interface
○○✸● ○○○○	External unit not ready or not connected

By pressing STOP the error messages can be cleared.

16.3.4 Error Messages at the TNC in the FE Mode

In this operating mode, the floppy disk unit outputs errors in the following format:

(SOH) ERR: (SP) (SP) (SP) [XXX] (ETB) (BCC)
XXX = error number

The following errors can be displayed on the screen:

Input/Output Errors

ERR: 001 = wrong command code
ERR: 002 = illegal program name
ERR: 003 = faulty data transfer
ERR: 004 = program incomplete
ERR: 005 = receiving buffer overflow
ERR: 006 = function currently disabled
ERR: 007 = data-buffer overflow

Errors during Program Write or Read

ERR: 010 = program not on disk
ERR: 011 = program erase-protected
ERR: 012 = program is being written to
ERR: 013 = program directory is full
ERR: 014 = disk is full
ERR: 015 = text not found
ERR: 016 = program name already exists
ERR: 017 = disk access active
ERR: 018 = program currently being read

Disk / Drive / Controller Errors

ERR: 100 = disk not initialized
ERR: 101 = sector number too large [1)]
ERR: 102 = drive not ready [2)]
ERR: 103 = disk is write-protected
ERR: 104 = faulty data on disk [1)]
ERR: 105 = sector cannot be found[1)]
ERR: 106 = check sum incorrect [1)]
ERR: 107 = disk controller defective [3)]
ERR: 108 = DMA defective [3)]
ERR: 109 = disk exchanged during program loading

[1)] These error messages indicate that the disk is defective; in most cases, they can only be eliminated by formatting the disk anew.

[2)] If this error message comes up while the disk is inserted, the drive is probably defective.

[3)] Hardware defect

16.3.5 Error Messages during Data Transfer

TRANSFERRED VALUE ERRONEOUS X

X = A faulty character frame
B character overflow
C faulty character frame or character overflow
D parity error
E faulty character frame or parity error
F character overflow or parity error
G faulty character frame or character overflow or parity error
H receiving-buffer overflow
K, L } incorrect ESC sequence (only in ME mode)

TRANSFERRED DATA INCORRECT X

X = A faulty character frame
D parity error
M control has received the character for "negative acknowledgement" (NAK) more than 3 times
N control has sent the character for "negative acknowledgement" (NAK) more than 3 times

BAUD RATE NOT POSSIBLE

If both data interfaces (RS 232 / RS 422) are activated simultaneously, the baud rates of **both** interfaces must be the same.

INTERFACE ALREADY ASSIGNED

A data interface cannot be used for two operating modes simultaneously. (e.g. DNC mode and programming at the same time is not possible with one data interface.)

EXT. IN-/OUTPUT NOT READY

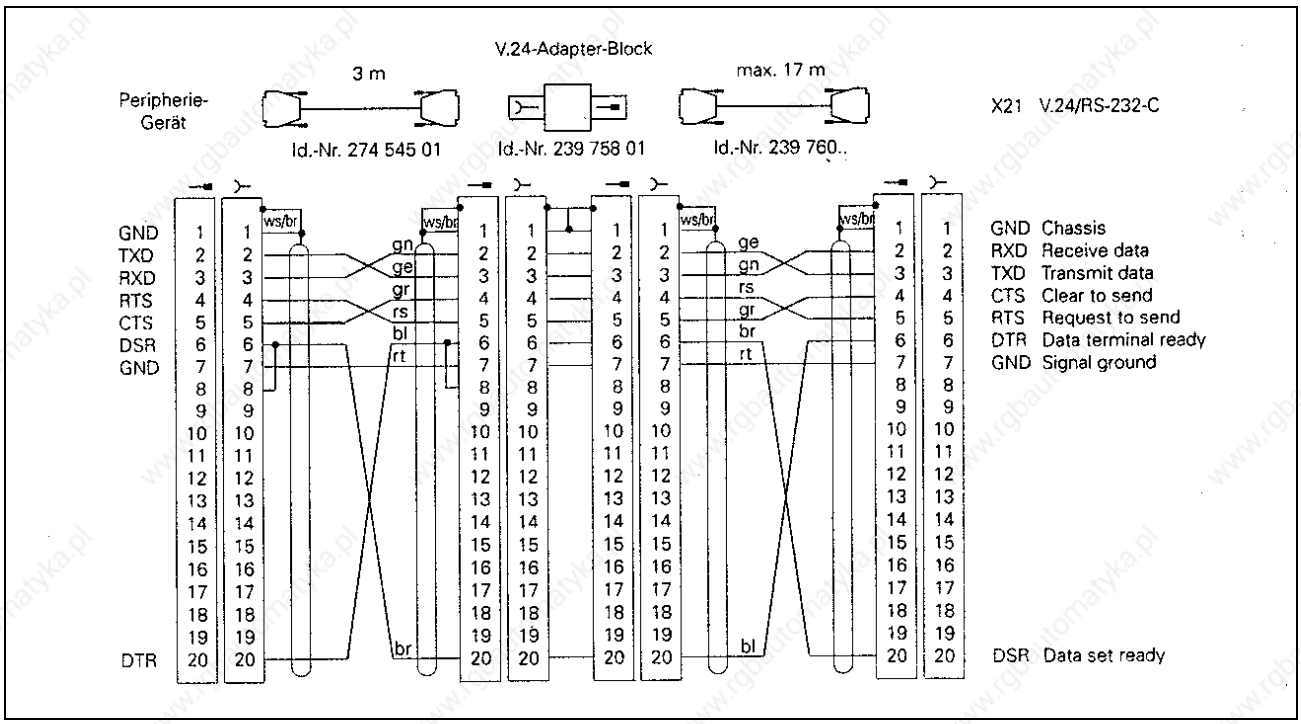
- DSR signal at the TNC missing
- Defective or wrong transfer cable
- Wrong interface assignment

PROGRAM INCOMPLETE

Data transfer was interrupted before the program was completely loaded.

16.4 Wiring Diagrams of the Data Interfaces

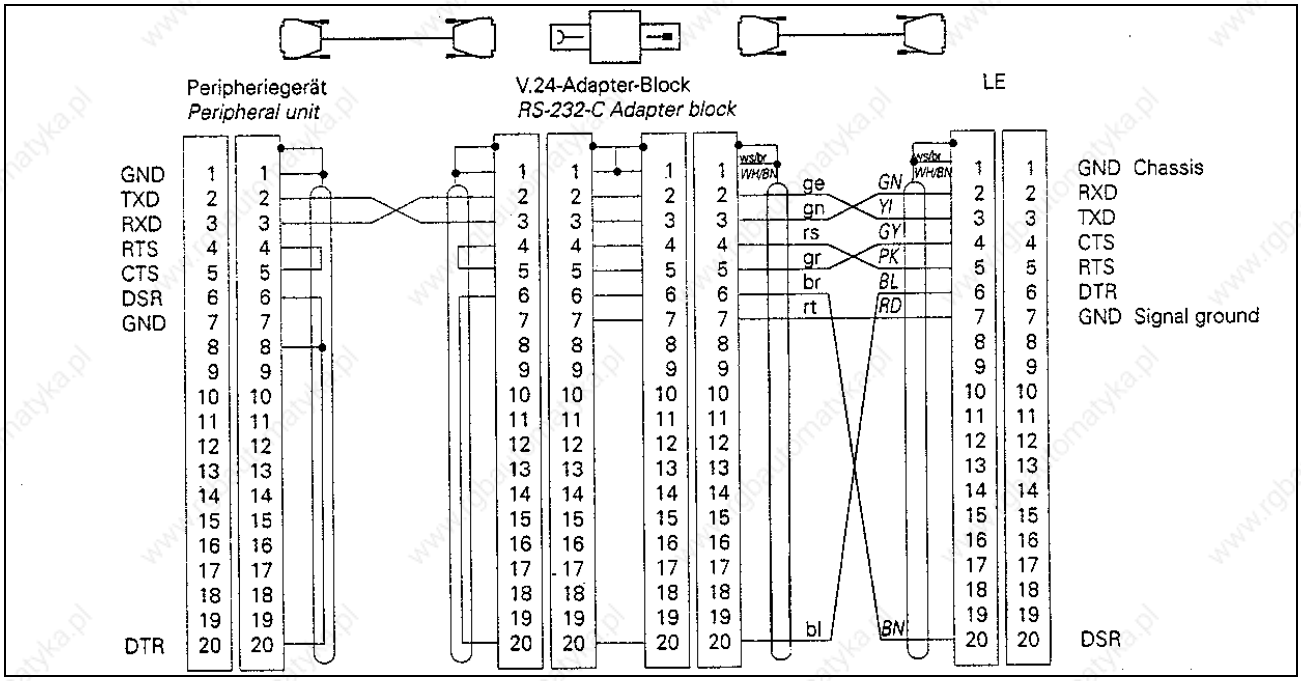
16.4.1 RS-232-C Data Interface with RS-232-C Adapter Block (full wiring)



If the pin layout of your peripheral unit differs from the above layout, the HEIDENHAIN connecting cable may not be used.

16.4.2 RS-232C Data Interface with RS-232C Adapter Block (simplified wiring)

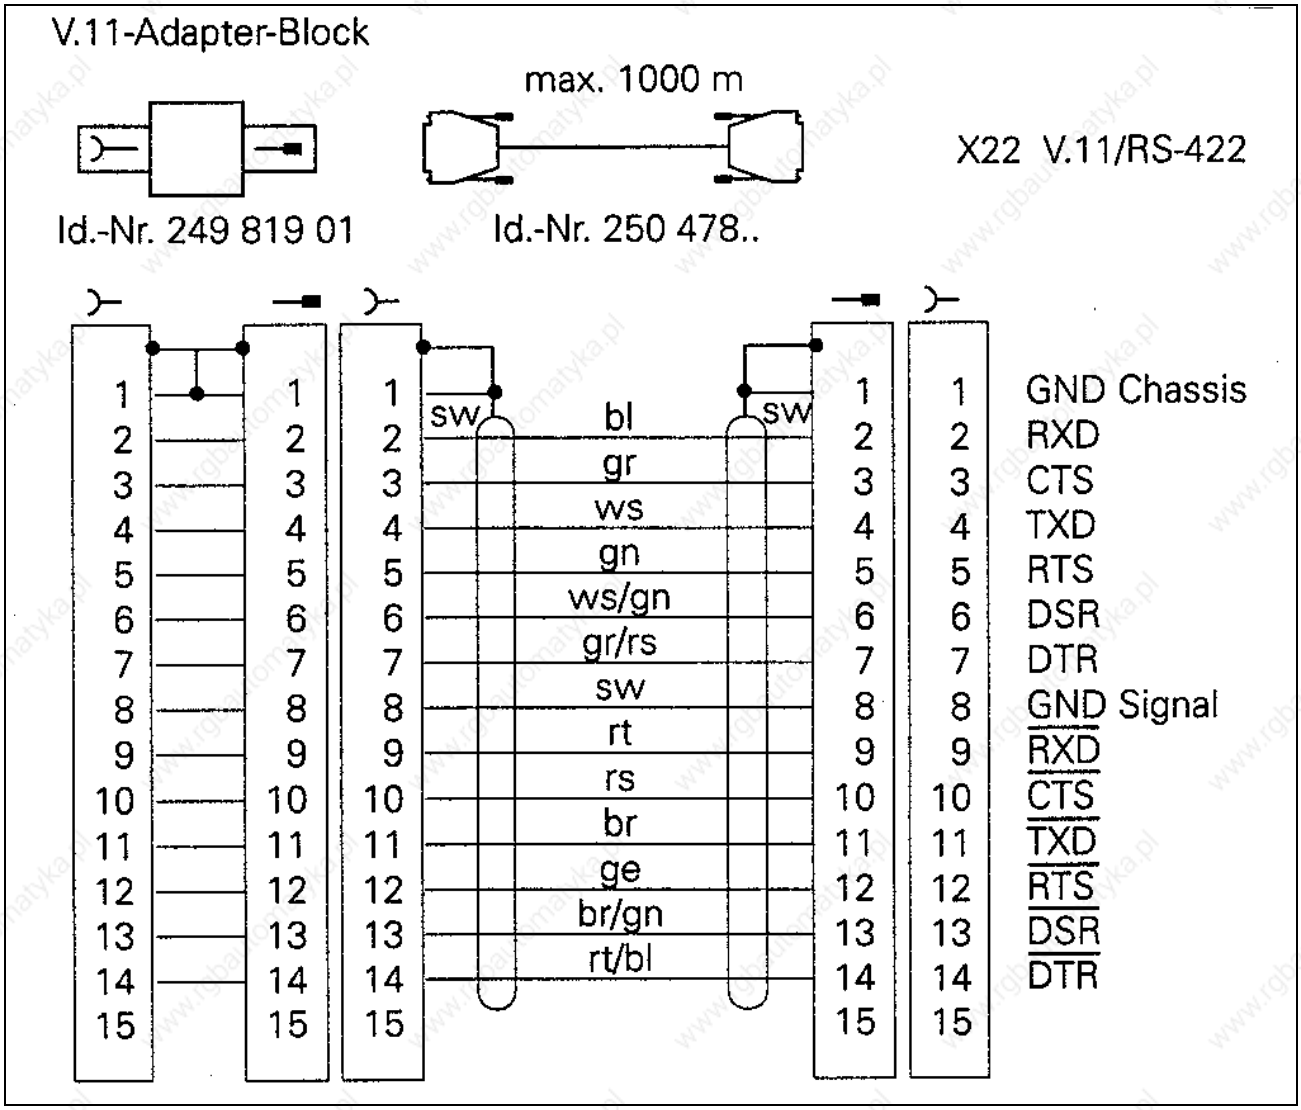
Example:



With this wiring, only transfer stop with DC3 is possible (software handshake).

The RS-232-C data interface has **different** pin layouts at the logic unit X21 and the RS-232-C adapter block.

16.4.3 RS-422 Data Interface

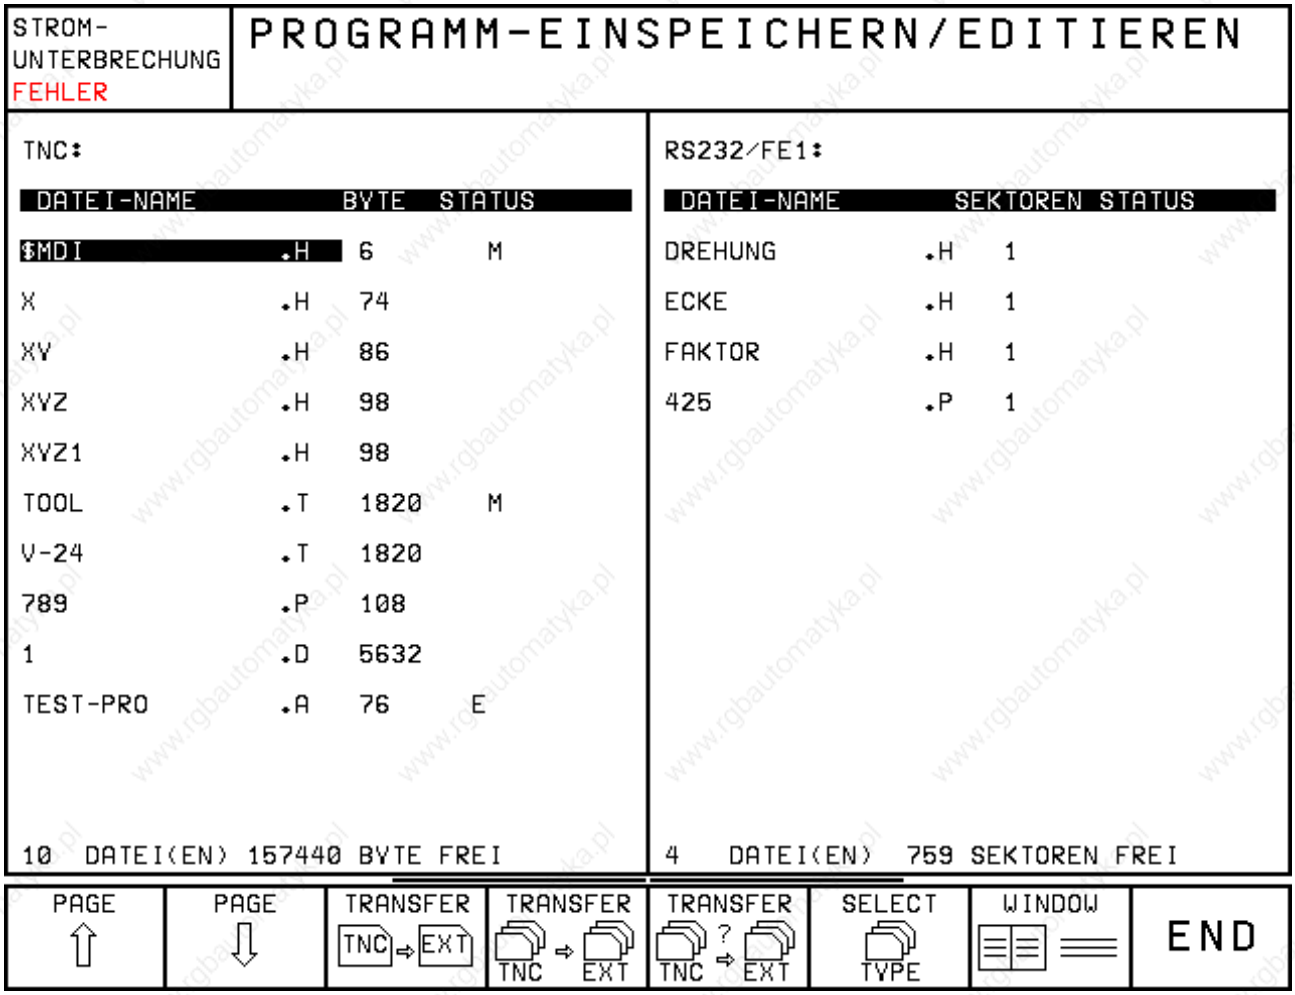


The RS-422 data interface has **identical** pin layouts at the logic unit X22 and at the RS-422 adapter block.

17. Data Input and Output

17.1 Data Transfer Menu

In the operating mode PROGRAMMING/EDITING (press ), the data transfer menu is activated by pressing  .

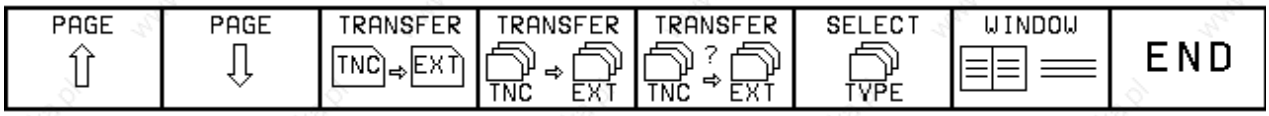


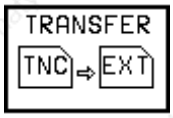
On the left half of the screen the memory contents of the TNC is displayed; on the right half the memory contents of the peripheral unit.
The memory contents of the peripheral unit is only displayed automatically in the interface mode FE1. In all other operating modes it can be loaded by means of the soft key 

.

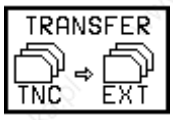
To switch between the screen halves press the arrow keys  and  .
By switching the screen half the **direction** of data transfer is changed.

Explanation of the soft keys:

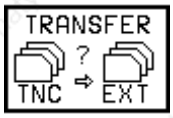




The program **selected** with ↑ or ↓ is read in or out.



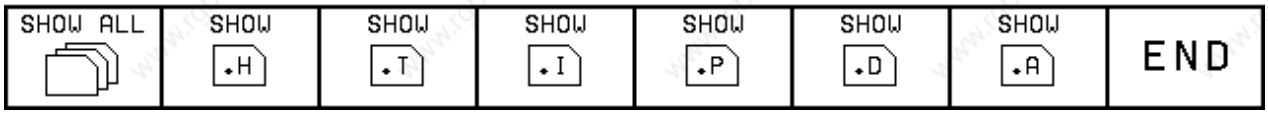
All programs are read in or out **without confirmation**.

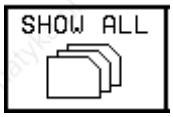


All programs are read in or out **after confirmation**.

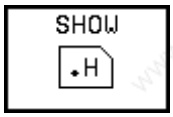
The following soft keys may be offered depending on the interface mode:

FE1 mode (external directory is loaded automatically):



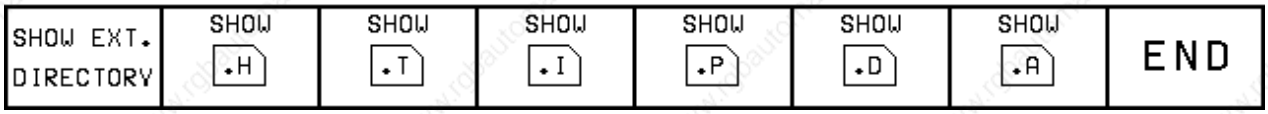


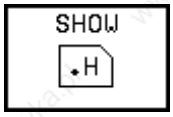
All file types are displayed.



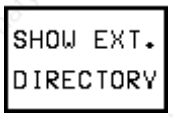
Only the files with this extension are displayed.
e.g. (**.**H = NC program in HEIDENHAIN plain language)

FE2 / EXT1 / EXT2 mode:



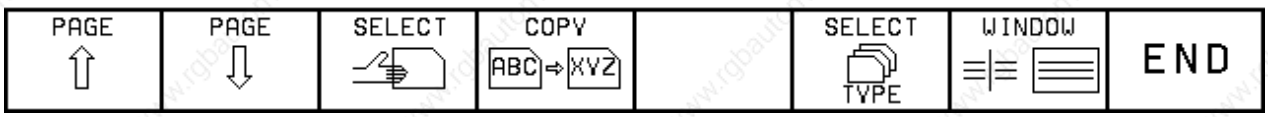


Only the files with this extension are displayed.
e.g. (**.**H = NC program in HEIDENHAIN plain language)



The external directory is loaded.

This soft key cancels the split screen display. Afterwards several settings can be made in the screen half selected before. After pressing the soft key once again, the screen is split again.



17.2 Overview of Files for TNC 415B/425

Depending on the subordinate mode (NC, PLC MODE, MP MODE etc.) in which the transfer menu is activated, only certain file types are offered to be downloaded or output.

The following data may be in the RAM:

NC Memory Management	**Extension (TNC)**	**Extension (external)**
NC program: HEIDENHAIN language	.H	.H
NC program: ISO	.I	.D
Active tool file	TOOL.T	TOOL.T
Tool data (table)	.T	.T
Pocket number table		TOOL_P.R
Pallet table	.P	.L
Datum table	.D	.N
Text file (ASCII)	.A	.A
Measuring point table (digitizing)	.PNT	.U
PLC Memory Management (RAM)		
PLC program	.PLC	.P
Error messages 1. language	.ER1	.A
Error messages English	.ERE	.A
Dialogues 1. language	.DI1	.A
Dialogues English	.DIE	.A
ASCII file	.A	.A
Help texts	.HLP	.J
Data for axis error compensation	.COM	.V
Data for axis error compensation	.CMA	.S
Machine Parameter Mode		
Machine parameter lists	.MP	.M
Compensation value table selectable via code number	.KOR	.S

Additional information on the files or programs is provided by letters in the status field.

E: The file/program has been selected in the PROGRAMMING mode.
S: The file/program has been selected and activated in the TEST RUN mode.
M: The file/program has been selected and activated in either PROGRAM RUN / FULL SEQUENCE or in PROGRAM RUN / SINGLE BLOCK.
P: The file/program is protected against erasing and editing.
IN: The table/program was programmed in Inch.
W: The file/program was not completely transferred to an external memory and thus is no longer available.

17.3 External Data Output

Preparations:

- Connect the external data medium (FE, ME or other peripheral unit, e.g. personal computer with HEIDENHAIN data transfer software) to the TNC.
- Prepare the external data medium for data transfer:

  Press STOP, TNC and →9 at the ME

  Press STOP at the FE.
- Select the operating mode, the baud rate and the interface assignment at the TNC (see section 16.1).

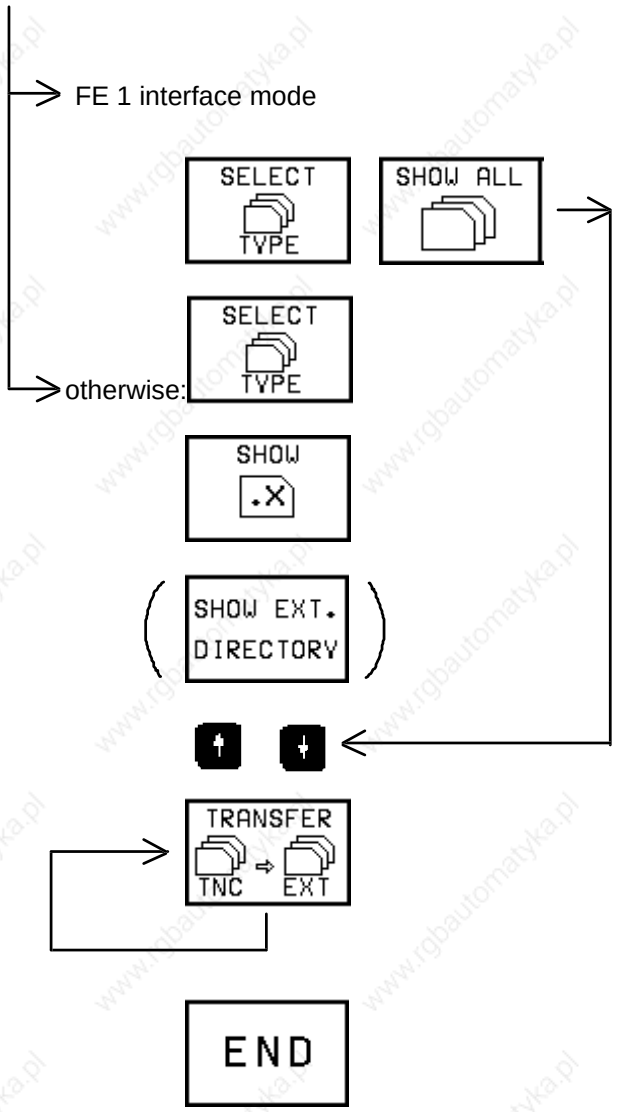
17.3.1 Output of Files with the Extensions .H, .I, .T, .D, .P, .A, .PNT

Press Key	Function
 	Operating mode PROGRAMMING/EDITING Activate data transfer menu

The different file types are distinguished by the file name and the extension.

In the TNC there are the following six different file types that can be selected via soft key:

- HEIDENHAIN dialogue programs <file name> .**H**
- ISO programs <file name > .**I**
- Tool tables <file name > .**T** [1)]
- Datum tables <file name > .**D**
- Pallet tables <file name > .**P**
- Text files (ASCII) <file name > .**A**
- Point files <file name > .**PNT**



Soft keys to display all file types

Select file type

Soft key to confirm desired file type

Call external directory

Select file by pressing arrow keys

Start data transfer [2)]

Output further files

Soft key to exit data transfer

TNC in operating mode PROGRAMMING/EDITING

1) The file **TOOL.T** (active tool table) must be read out in another operating mode (see section 17.3.2)

2) see section 17.2

17.3.2 Output of TOOL.T File (Active Tool Table) and of POCKET-TABLE

Press Key	Function
	TNC in MANUAL operating mode
TOOL TABLE	Call tool table
	Activate data transfer menu
TRANSFER TNC ⇨ EXT	Read out tool table
	The active tool table is output to the external data medium; filename: **TOOL.T**
POCKET TABLE	Call pocket table
	Activate data transfer menu
TRANSFER TNC ⇨ EXT	Read out pocket table
	The POCKET TABLE is output to the external data medium; filename: **TOOL_P.R**
END	Exit subprogram

17.3.3 Output of the Machine Parameter List <NAME>.MP

NOTE:
The TNC only displays the external directory in the FE1 mode.

Press Key	Function
	TNC in operating mode PROGRAMMING AND EDITING
	Prepare TNC for entry of code number
	Enter code number and confirm with ENT
	Here an interface can be allocated to the MP editor
	
	Activate data transfer menu

There may be **several** files with the extension .MP in the TNC. The active machine parameter list is distinguished by the STATUS **M**.

	Soft key for data transfer
	Exit data transfer menu
	TNC in operating mode PROGRAMMING AND EDITING

17.3.4 Output of the Compensation Value List for Multipoint Axis Error Compensation <NAME>.KOR

NOTE:
The TNC only displays the external directory in the FE1 mode.

Until NC software 259 93x.**07** and 259 94x.**07** the compensation values and the axis relations were filed in **one** table (file with extension **.KOR**). This file is stored in the RAM of the TNC and can be read out.

Press Key	Function
	TNC in operating mode PROGRAMMING AND EDITING
	Prepare TNC for entry of code number
	Enter code number and confirm with ENT
	Activate data transfer menu
	Press soft key
	The file <NAME>.**KOR** is stored on the external data medium as <NAME>.**S**
	Exit data transfer menu
	TNC in operating mode PROGRAMMING AND EDITING

NOTE:
The TNC only displays the external directory in the FE1 mode.

As of NC software 259 93x.**08** and 259 94x.**08** the compensation values and axis relations can be stored as files with the extensions .**COM** and .**CMA**.

Press Key	Function
	TNC in operating mode PROGRAMMING AND EDITING
	Prepare TNC for entry of code number
	Enter code number and confirm with ENT
	Activate data transfer menu
	Here the PLC editor can be assigned to an interface
	
	Press arrow key to select the TNC directory
	Soft key and arrow key on VDU
	List <NAME>.COM
	Read out <NAME>.COM
	Soft key and arrow key on VDU
	List <NAME>.CMA
	Read out NAME>.CMA

If no .CMA file is defined and multipoint axis error compensation selected via MP730, the compensation value tables of the code number 105296 are valid.

17.3.5 PLC File Management

Press Key	Function
	TNC in operating mode PROGRAMMING AND EDITING
MOD	Prepare TNC for entry of code number
8 0 7 6 6 7 ENT	Enter code number and confirm with ENT
PGM NAME	Call file manager
	Split screen
	Press soft key
	Press soft key

The PLC is subdivided into two **internal** drives.
Drive TNC: PLC files in RAM [1)]
Drive TNC/EPROM: PLC files in PLC EPROM [1)]

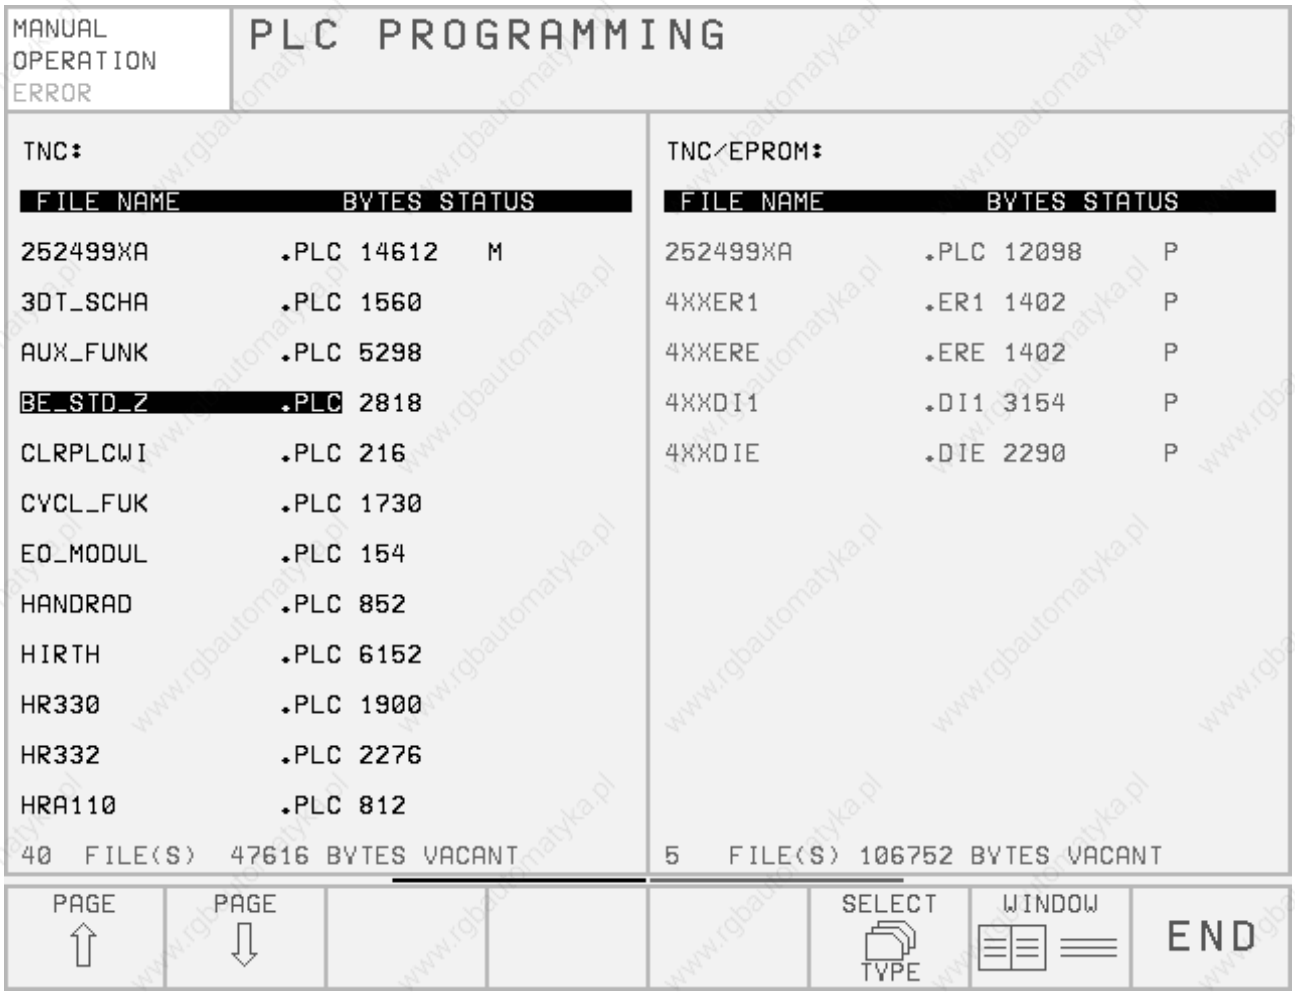
The following files may be stored:

PLC programs		.PLC
Error messages	1. language	.ER1
Error messages	English	.ERE
Dialogues	1. language	.DI1
Dialogues	English	.DIE
ASCII files		.A
Help texts		.HLP
Data for axis error compensation		.COM
Data for axis error compensation		.CMA

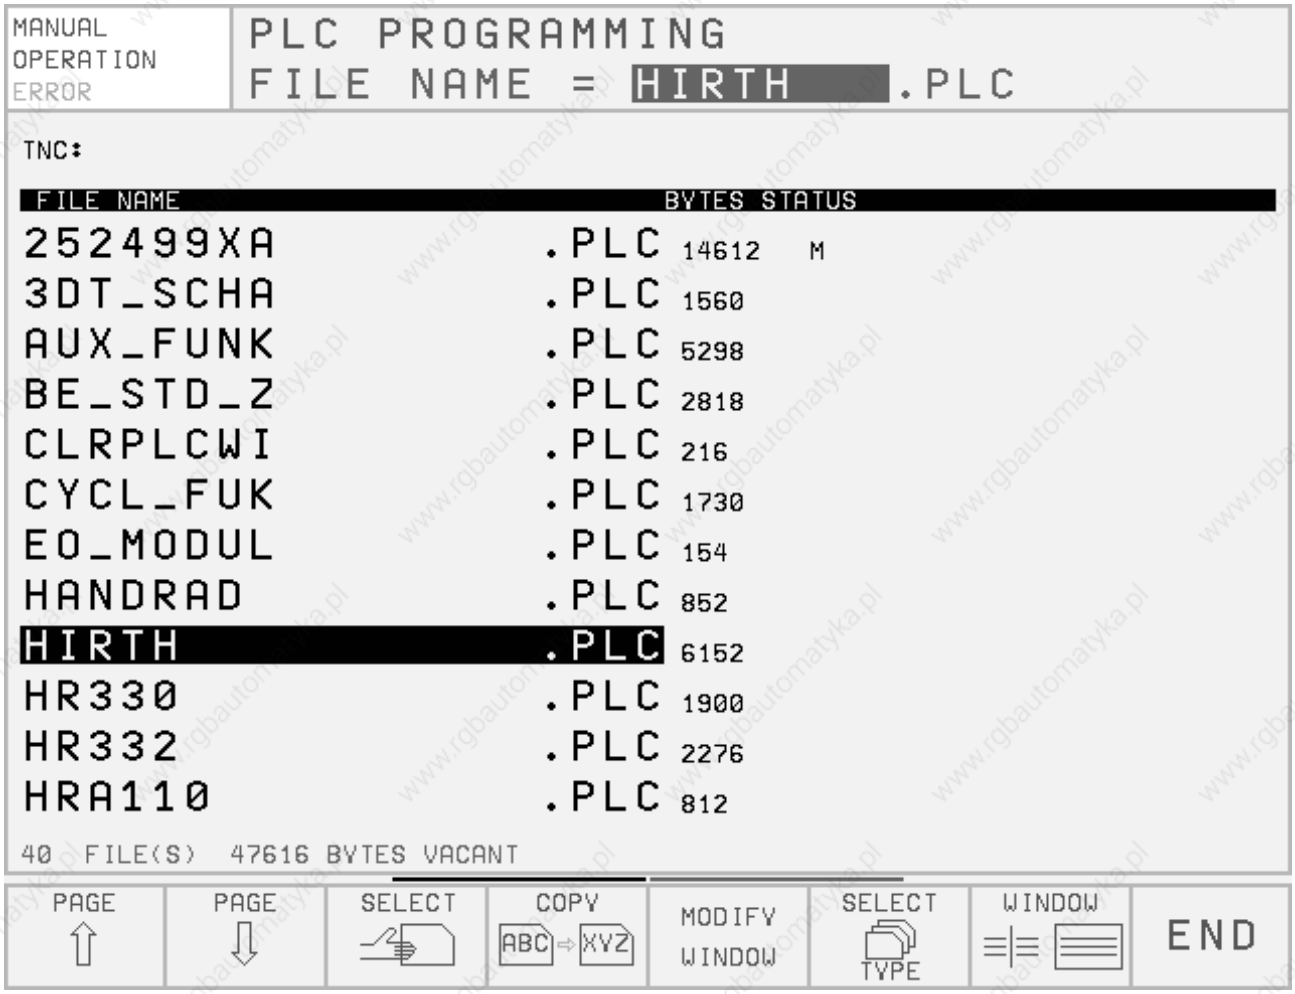
For each half of the screen the required "drive" can be selected by soft key.

[1)] Between the PLC RAM and the PLC EPROM similar functions are possible as between the RAM and external data medium.

Selecting the Drives



Press Key	Function
← or →	Select the window to be modified
◁ or ▷	Switch soft key row
MODIFY WINDOW	Press soft key



Press Key	Function
SELECT XXX	Assign the "drive" by pressing a soft key
END	Press soft key
◁ or ▷	Switch soft key row back

17.3.6 Output of Files from PLC Memory

NOTE:
The TNC only displays the external directory in the FE1 mode.

Overview of the Files

PLC programs		.PLC
Error messages	1. language	.ER1 [1]
Error messages	English	.ERE [1]
Dialogues	1. language	.DI1 [1]
Dialogues	English	.DIE [1]
ASCII files		.A [1]
Help texts		.HLP
Files for axis error compensation		.COM [2]
Files for axis error compensation		.CMA [2]

[1] **Note:**
The error messages, dialogues and ASCII files are output as ASCII files with the extension **.A**. Therefore, the files to be output must have different filenames so that they will not be overwritten on the external data medium.

(to rename a files, press the soft key 
.)

Note down filename and the extension!

After having downloaded the files, the extension **.A** must be reconverted to the **original** extension by pressing the soft key 
.

[2] see section 17.3.4

There may be several files with the same extension in RAM.
Note down status information (see section 17.2).

Press Key	Function
	TNC in operating mode PROGRAMMING AND EDITING
	Prepare TNC for entry of code number
	Enter code number and confirm with ENT
	Activate data transfer menu
	Soft keys to display all file types List desired file type Select desired file with arrow keys (if necessary) Rename file with soft key (if necessary) Start data transfer [1] Output further file, if desired
	Soft key to exit the data transfer menu
	TNC in operating mode PROGRAMMING AND EDITING

[1] see section 17.1

17.4 Downloading External Data

Preparations:

- Connect the external data medium (ME, FE or other peripheral unit) to the TNC.
- Prepare the external data medium for data transfer:

  press STOP , TNC and → at the ME,

  press STOP at the FE.·
- Select the operating mode, the baud rate and the interface assignment (see 16.1) at the TNC.

17.4.1 Downloading files with the Extensions .H, .I, .D, .P, .T, .A

Press Key	Function
	TNC in operating mode PROGRAMMING AND EDITING
EXT	Activate data transfer menu
	Press arrow key to select screen of external data medium
in interface mode FE 1	
SELECT TYPE / SHOW ALL	Soft keys to display all file types
otherwise:	Press arrow key on the VDU to switch the soft key row to display of all file types
SHOW .X	List desired file type
SELECT TYPE / SHOW EXT. DIRECTORY	Call directory of external data medium
	Select file with arrow key, if required
TRANSFER TNC ⇐ EXT	Start data transfer
	Download further files, if required
END	Soft key to exit data transfer menu
END	TNC in operating mode PROGRAMMING AND EDITING

The TOOL.T file (active tool table) must be downloaded in another operating mode (see section 17.4.2).

17.4.2 Downloading TOOL.T Files (Active Tool Table) and the POCKET TABLE

Press Key	Function
	TNC in MANUAL operating mode.
	
	EDIT on!
	Activate data transfer menu.
	Press soft key.
 	Downloading is not started.
	The **TOOL.T** file is downloaded from the external data medium. The existing file is **overwritten**!
	
	EDIT on!
	Activate data transfer menu.
	Press soft key-
 	Downloading is not started.
	The **TOOL_P.R** file is downloaded from the external data medium. The existing file is **overwritten**!
	Exit the subordinate mode.

17.4.3 Machine Parameter Input <NAME>.MP

Press Key	Function
	TNC in operating mode PROGRAMMING AND EDITING.
	Prepare TNC for input of code number.
	Enter code number, confirm with ENT.
	Here, the MP editor can be assigned to an interface.
	
	Activate data transfer menu.
	Press arrow key to enter the directory of the external data medium.
interface mode FE1	
	If necessary: select the desired MP file by pressing the arrow keys.
otherwise:	
	Enter name of MP file (ASCII or numerical keys).
	Soft key for data input.
	Exit the data transfer menu [1]
	The machine parameter file loaded in the editor is activated (receives the status **M**, see section 17.3.3).

1) If several MP files are downloaded after each other, the TNC activates the MP list downloaded last.

When the error message

OPERATING PARAMETERS ERASED

is displayed, enter the machine parameter file <NAME>.MP as follows:

(see section 2.1)

Press Key	Function
CE	Clear the error message OPERATING PARAMETERS ERASED
MOD	Configure the interface (see section16.1)
END	
EXT	Activate the data transfer menu.
interface mode FE1	
	If necessary: select the desired MP file by pressing the arrow keys.
otherwise	Enter the name of the MP file (ASCII or numerical keys).
...	
TRANSFER TNC ⇦ EXT	Start data transfer.
END	Exit the data transfer menu.
END	The machine parameter file loaded in the editor is activated (receives the status **M**, see section 17.3.3).

17.4.4 Input of the Compensation Value List for Multipoint Axis Error Compensation <NAME>.KOR

NOTE:
The TNC displays the external directory only in the FE1 mode.

Until NC-software 259 93x.**07** and 259 94x.**07** the compensation values and the relations are filed in **one** table (file with extension **.KOR**).

Press key	**Function**
	TNC in operating mode PROGRAMMING AND EDITING.
	Prepare TNC for input of code number.
	Enter code number, confirm with ENT.
	Activate data transfer menu.
	Press arrow key to enter the directory of the external data medium.
	
	If necessary: select desired compensation value list by pressing an arrow key.
	Enter the file name of the compensation value list (ASCII or numerical keys).
	Start data transfer.
	Exit the data transfer menu.
	TNC in operating mode PROGRAMMING AND EDITING

From NC-software 259 93x.**08** and 259 94x.**08** the compensation values and the relations can be stored in files with the extensions .**COM** and .**CMA**.

If there is no <NAME>.**CMA** file on the external data medium, the compensation value tables from the code number 105 296 are valid. These files can be read in as described in section 17.4.4.

Press key	Function
	TNC in operating mode PROGRAMMING AND EDITING. Prepare TNC for input of code number. Enter code number, confirm with ENT. Activate the data transfer menu. Here, the PLC editor can be assigned to an interface. Press soft key. Press arrow key to enter the directory of the external data medium. Soft key and arrow key on VDU. Press soft key. If necessary: press arrow key to select the desired <NAME>.COM file. Enter the name of the <NAME>.COM file (ASCII or numerical keys). Start data transfer [1] (continued on page 116)

[1] **Caution**: Until the software version 12 the dimensions "MM" must be contained after the file name in the header of a <NAME>.COM file; otherwise the file cannot be read in (if required, use a text editor to insert MM)

Example of a header: **`BEGIN X-AXIS.COM MM DATUM:+90 DIST:2`**

Press key	Function
	Press soft key and arrow key on VDU. Press soft key. If necessary: press arrow key to select the desired <NAME>.CMA file. Enter the name of the <NAME>.CMA file (ASCII or numerical keys). Start data transfer. Exit the data transfer menu after data transfer.

17.4.5 Downloading PLC Program, Error Messages, Dialogues and Help Texts

NOTE:
The TNC displays the external directory only in the FE1 mode.

The error messages and the dialogues are downloaded as **ASCII** files (<NAME>.A). They need to be converted to their original file types afterwards.

Press key	Function
	TNC in operating mode PROGRAMMING AND EDITING. Prepare TNC for input of code number. Enter code number, confirm with ENT. Activate the data transfer menu. Press arrow key to enter the directory of the external data medium. Press soft keys. If necessary: Press arrow key to select the desired file. Start data transfer. Download further files if required. Press soft key to select the desired file extension. Enter the name of the file to be downloaded. (ASCII or numerical keys) Press soft key. Download further files if required.

After reading in the files, the error messages and dialogues need to be reconverted into their original file types.

Error messages	1. language:	<NAME>.**A**	⇒	<NAME>.**ER1**
Error messages	English:	<NAME>.**A**	⇒	<NAME>.**ERE**
Dialogues	1. language:	<NAME>.**A**	⇒	<NAME>.**DI1**
Dialogues	English:	<NAME>.**A**	⇒	<NAME>.**DIE**

Press key	**Function**
←	Press arrow key to select the TNC directory.
SELECT TYPE / SHOW ALL	Soft keys to display all file types.
↑ or ↓	Select the file to be converted.
WINDOW / ▷	Soft key and arrow key on VDU.
CONVERT ABC⇨XYZ	Start conversion.
.XXX FILES	Soft key for desired file extension.
	Convert further files if required.

After the conversion into the original file types, the ASCII files that were converted must be deleted.

CL PGM	
↑ or ↓	Select desired file.
DELETE	Delete file.
	Delete further files if required.
PGM NAME	
END	Press soft key.

If the PLC program is run from RAM (MP 4010 = 1) and several files of the type <NAME>.PLC are contained in RAM, the PLC program that had the status **M** before it was transferred, must be loaded into the process memory. (see section 19.5)

If there are several dialogue or error message files in RAM, the desired file can be selected via soft key.

Press key	**Function**
	TNC in PLC menu.
	Press soft key.
 or	Select desired file.
	Press soft key.
	Press soft key.

18. Analogue Outputs

18.1 Specifications

6 outputs 1, 2, 3, 4, 5 and S

Load capacity: $R_{Lmin} \geq 5\ k\Omega$
$C_{Lmax} \leq 2\ nF$

Voltage range: $U_{amax} = \pm 10V \pm 100\ mV$
$U_{amin} = 0V \pm 3\ mV$

Machine parameters for the analogue outputs

Analogue outputs	MP	Entry values
X	120.0	0 = output 1
Y	120.1	1 = output 2
Z	120.2	2 = output 3
IV	120.3	3 = output 4
V	120.4	4 = output 5
		5 = output S

Resolution:	16 Bit = 65 536 steps
Smallest step	$\frac{10\ V}{65\ 536} = 0.153\ mV$

18.2 Checking the Analogue Outputs

18.2.1 Axes with Analogue Speed Controller

Proportionally to the traversing speed, the control generates an analogue voltage of 0V to 9V (rapid traverse). The easiest way to determine this voltage is to connect the test adapter directly to the logic unit or to the connecting terminals of the servo-amplifiers and to measure with a multimeter.

If however, the axis does not move due to a defect, and you want to test whether the error is inside or outside the control, the following steps are recommended:

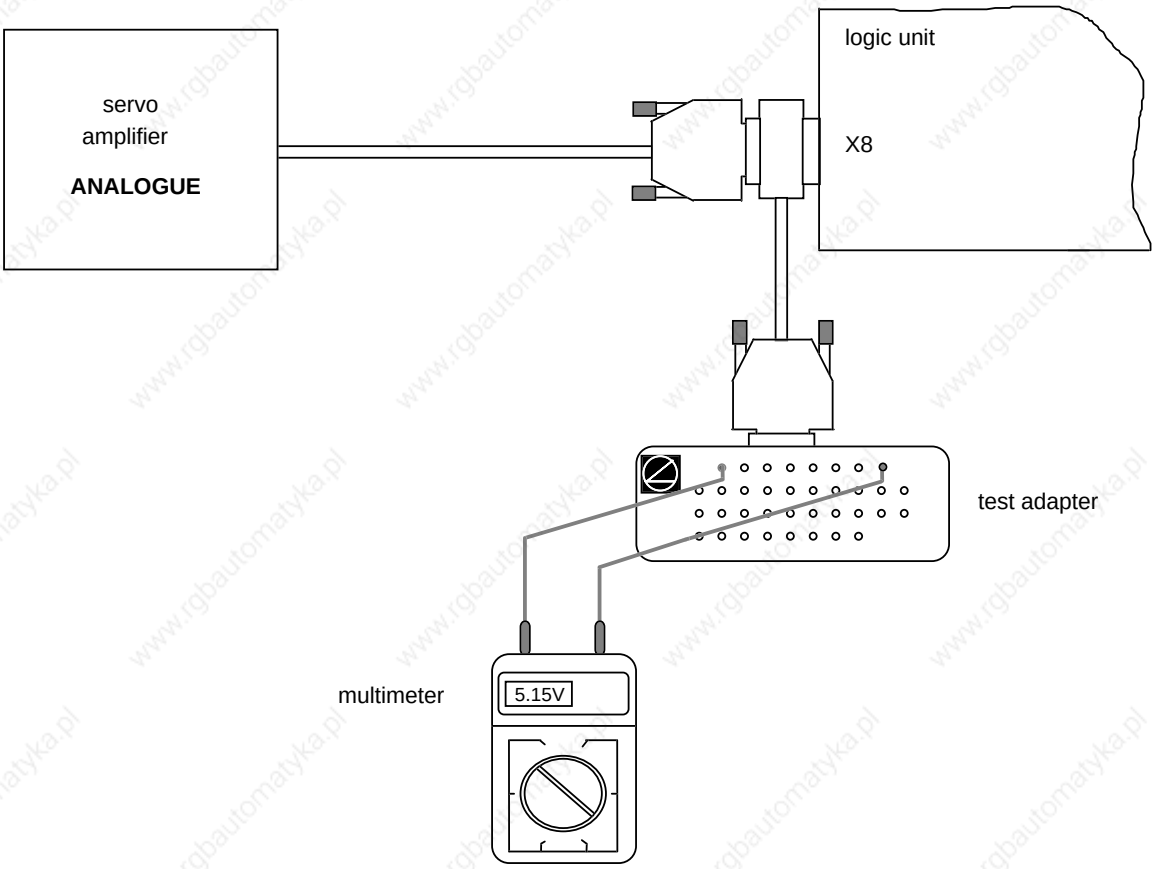
- Switch off the main switch at the machine tool.
- Connect the test adapter to the connector X8 (nominal value output) of the LE and connect a multimeter to the test adapter sockets for the defective axis. If no test adapter is available, connect a multimeter directly to the nominal value output of the servo-amplifier.
- Switch on the main switch and the control voltage.
- Switch the position display to LAG (servo lag) (see section 18.3).
- Check and adjust the following machine parameters:
  (If you alter a machine parameter, note down the original value and enter it again after finishing the test.)

MP	Entry Value	Function	Original Value
1410.X	30 [mm]	Servo-lag monitoring (erasable), feed forward	
1420.X	30 [mm]	Servo-lag monitoring (EMERG. STOP), feed forward	
1140.X	9.99 [V]	Movement monitoring	
1710.X	300 [mm]	Servo lag monitoring (erasable), trailing mode	
1720.X	300 [mm]	Servo lag monitoring (EMERG. STOP), trailing mode	

- Traverse the reference points that need to be traversed before those of the defective axis.
- Turn the override potentiometer of the keyboard unit completely to the left and start reference mark traverse for the defective axis.
- Check the axis enable for the defective axis at the servo amplifier.
- Check the screen display.
  ***** (Control ready for operation) must be ON, the **F** of the feed rate display must be normally lit (if the display is inverse, the feed rate enable is missing), and the symbol for "Axis not in the position loop" (e.g. →|← **X**) should not follow the position display.
- Turn the override potentiometer slowly to the right and turn it back left again before the servo lag display reaches the limit of the position monitoring.

When the override potentiometer is turned to the right, the control outputs an analogue voltage which is increased proportionally to the servo lag up to a maximum value of 10V. The control operates correctly, if a voltage of 10V ± 0.1V can be measured at the test adapter with the multimeter. If no voltage can be measured, switch off the main switch, unplug the connector X8 from the logic unit, disconnect the nominal value line from the servo amplifier and test this line for short-circuit. If the nominal value line is in order, connect X8 to the logic unit again (leave the nominal value line disconnected), switch on the main switch and repeat the measurement with reference mark traverse. If an analogue voltage can be measured now, the control operates correctly. If no voltage can be measured, the analogue output of the logic unit is probably defective.

Measuring Setup to Check the Analogue Outputs



X8 Nominal value output for 1, 2, 3, 4, 5, S

flange socket with female insert (15-pin

Pin No.	Signal
1	analogue output 1
3	analogue output 2
5	analogue output 3
7	analogue output 4
4	analogue output 5
8	analogue output S axis
9	0V analogue output 1

Pin No.	Signal
11	0V analogue output 2
13	0V analogue output 3
14	0V analogue output 4
6	0V analogue output 5
15	0V analogue output S axis
housing	external shield = housing
2, 10, 12 do not assign	

Observe the safety instructions!

18.2.2 Axes with Integral Digital Speed Controller

Depending on the machine parameter MP1900 the driving axes of TNC 425/E are individually defined as **analogue axes** (as TNC 415 B/F) or as **digital axes**.
With axes with **integral digital speed controller** (corresponding bit of MP1900 = 1) a TTL voltage is output at the analogue output.

If however, the axis does not move due to a defect, and if you want to test whether the error is inside or outside the control, the following steps are recommended:

- Switch off the main switch.
- Disconnect the **nominal value line** from the connector X8 and check for short-circuit and line disconnection.
- If the **nominal value line** is in order, leave it disconnected and connect the test adapter to the connector X8.
- Switch on main switch and machine control voltage.
- Switch the position display to LAG (servo lag); see section 18.3.
- Define the axis to be checked as **analogue** controlled axis (MP1900, corresponding bit = 0)

Function	**MP No.**	**Bit**	**Entry range**	**Original** [1] **Entry Values**
Axes with digital speed controller	1900		0 to 31 0 = analogue-controlled axis	
X		0	+1 = X-axis digital controlled	
Y		1	+2 = Y-axis digital controlled	
Z		2	+4 = Z-axis digital controlled	
IV		3	+8 = IV. axis digital controlled	
V		4	+16 = V. axis digital controlled	

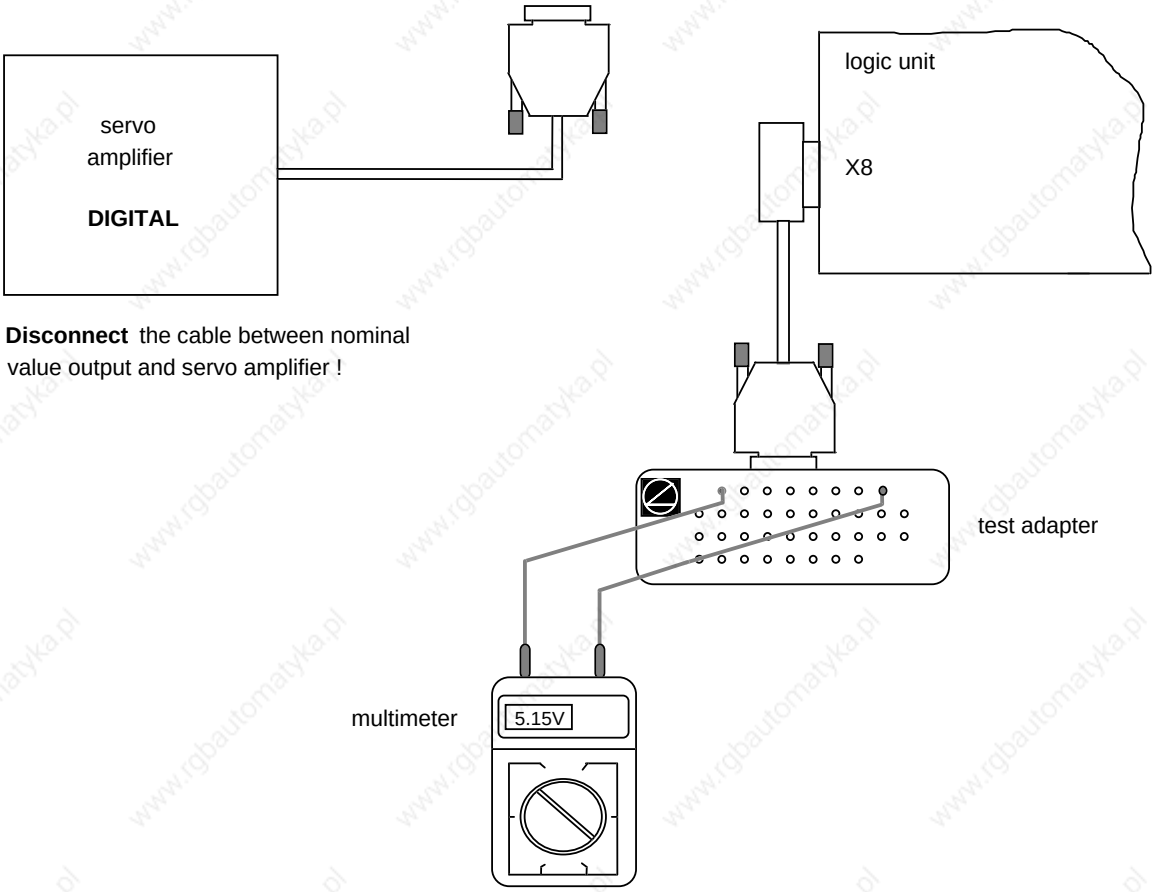
- The following machine parameters need to be checked and adapted. (Do not forget to re-enter the original values after having finished the test!)

MP	**Entry Value**	**Function**	**Original Entry Values**
1410.X	30 [mm]	Servo lag monitoring (cancellable), feed forward control	
1420.X	30 [mm]	Servo lag monitoring (EMERG. STOP), feed forward control	
1140.X	9.99 [V]	Movement monitoring	
1710.X	300 [mm]	Servo lag monitoring (cancellable), trailing operation	
1720.X	300 [mm]	Servo lag monitoring (EMERG. STOP), trailing operation	

- Turn the override potentiometer of the keyboard unit completely to the left and start reference mark traverse for the defective axis.
- Check the axis enable for the defective axis at the servo amplifier.
- Check the screen display
  ***** (control ready for operation) must be switched on, the **F** of the feed rate display must be lit normally (if the display is inverse the feed rate enable is missing) and the symbol for "axis not in position loop" (e.g. →|← **X**) must not follow the position display.
- Turn the override potentiometer slowly to the right and turn it back left before the servo lag display reaches the limit of the position monitoring.

When the override potentiometer is turned to the right, the control outputs an analogue voltage which is increased proportionally to the servo lag up to a maximum value of 10V. The control operates correctly, if a voltage of 10V ± 0.1V can be measured at the test adapter with the multimeter. If no voltage can be measured, the analogue output of the logic unit is probably defective.

Measuring Setup to Check the Analogue Outputs



X8 Nominal value output for 1, 2, 3, 4, 5, S

flange socket with female insert (15-pin)

Pin No.	Signal
1	analogue output 1
3	analogue output 2
5	analogue output 3
7	analogue output 4
4	analogue output 5
8	analogue output S axis
9	0V analogue output 1

Pin No.	Signal
11	0V analogue output 2
13	0V analogue output 3
14	0V analogue output 4
6	0V analogue output 5
15	0V analogue output S axis
housing	external shield = housing
2, 10, 12 do not assign	

Observe the safety instructions!

18.3 Switching Over the Position Display

Press Key	Function
	TNC in operating mode MACHINE (manual, full sequence etc.)
	Activate MOD function

	Select dialogue POSITION DISPLAY
	Switch to desired display mode NOML: nominal position DIST: distance-to-go ACTL: actual position REF: distance to reference mark (machine datum); with distance-coded measuring system zero REF mark LAG: current servo lag
END	Exit the subprogram

18.4 Adjustment of the Feed Rate

18.4.1 Axes with Analogue Speed Controller

Check and adapt the machine parameters (note down the original entry values).

MP	Entry Value	Function	Original Entry Value
1390	0	feed forward control [1] ON in automatic operating modes	
7290.X	6	display step = 0.1 µm	

- Switch position display to LAG (servo lag).

- Enter the following test program (e.g. for X axis)

```
0  BEGIN PGM  X  MM
1  LBL 1
2  X + 0  F  MAX
3  X + 100  F  MAX      (select a larger traverse range if possible!)
4  CALL LBL  1  REP  100/100
5  END PGM  X  MM
```

- Run the test program in the operating mode "PROGRAM RUN / FULL SEQUENCE".

- Adjust the feed rate at the servo amplifier (tachometer) until the servo lag display is approximately zero for positioning in both directions.

- Repeat the adjustment for all axes.

- Reset the machine parameters and the position display to the original values.

[1] The operating mode "feed forward control" must be optimized.

18.4.2 Axes with Integral Digital Speed Controller

Depending on the machine parameter MP1900 the driving axes of TNC 425/E are individually defined as **analogue axes** (as TNC 415 B/F) or as **digital axes**.

With axes with **integral digital speed controller** (corresponding bit of MP1900 = 1) the feed adjustment of the servo amplifier as described in section 18.4.1 is not required.

18.5 Offset Adjustment

18.5.1 Axes with Analogue Speed Controller

a) Offset Adjustment with Code Number

Press Key	Function
	TNC in operating mode PROGRAMMING AND EDITING Prepare TNC for entry of code number Enter code number for offset adjustment and confirm with ENT

Now the contents of the offset memory is displayed on the screen in converter steps (1 conv. step = 0.153 mV).
From left to right: X, Y, Z, IV, V.

	Offset compensation is executed Offset is not executed or is cancelled

The offset adjustment with code number only compensates the **current** offset. Subsequent offset modifications are **not** compensated.

b) Cyclic Offset Adjustment via Machine Parameters

In the machine parameter MP1220 the cycle time is defined [1s] after which an offset is compensated by one converter step.
To switch off the automatic offset adjustment, enter the value 0 in the machine parameter MP1220.

NOTE:
If an offset voltage of 100 mV is reached with automatic offset adjustment, the control switches off, generating the error message

GROSS POSITIONING ERROR <axis><CPU number> E

c) Offset Adjustment at the Servo Amplifier

- Check and adjust the following machine parameters. (Note down the original values before changing.)

MP	Entry Value	Function	Original Entry Value
1080.0 1080.1 1080.2 1080.3 1080.4	0 0 0 0 0	integral factor	
1220	0	cycle time for automatic offset adjustment	
1390	0	feed forward control ON	
1510.0 1510.1 1510.2 1510.3 1510.4	≥ 1 ≥ 1 ≥ 1 ≥ 1 ≥ 1	KV factor for feed forward control	
7290.X	6	display step = 0.1 µm	

- Switch position display to LAG (display of servo lag); see section 18.3.
- Cancel the offset compensation with code number (see item a)
- Adjust the offset at the servo amplifier until the values of the individual axes are zero or oscillate symmetrically about zero.
- Reset the machine parameter values and the position display to their original values.

18.5.2 Axes with Integral Digital Speed Controller

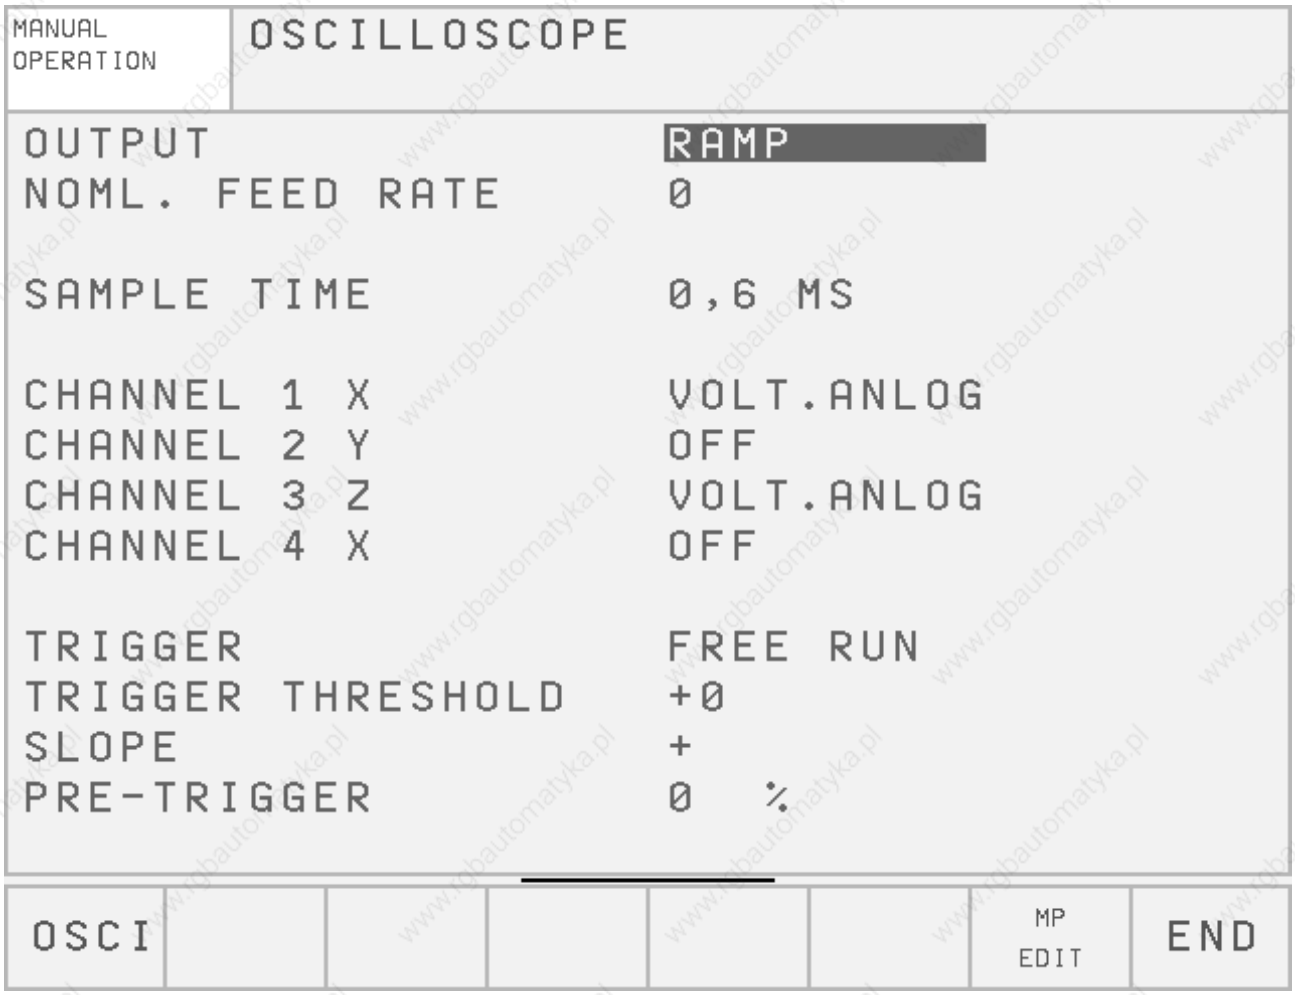
With axes with **integral digital speed controller** (TNC 425, corresponding bit of MP1900 = 1) the offset adjustment as described in section 18.5.1 is not required.

.

NOTES

18.6 Oscilloscope Function

TNC 415B/425 features an integral oscilloscope. To activate the OSCILLOSCOPE mode, enter the code number 688 379.



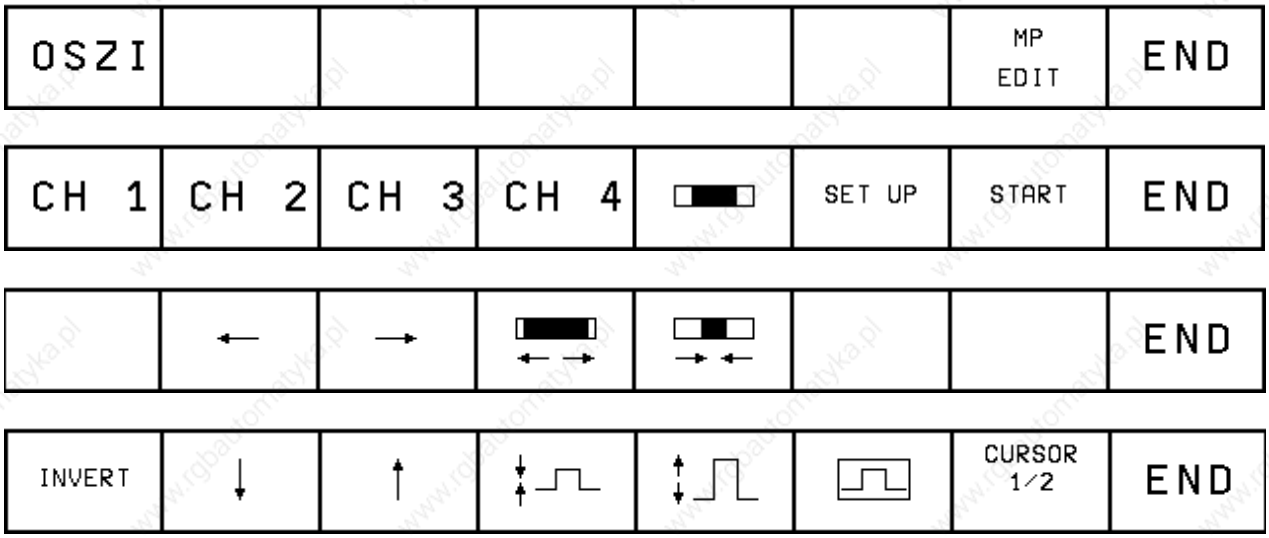
The axes, parameters and trigger conditions to be recorded are selected by pressing the cursor keys which move the cursor to the desired position.

The following characteristic curves can be displayed:

Feed rate	F ACTL	actual value (mm/min)
	F NOML	nominal value (mm/min)
Shaft speed [1]	N ACTL	actual value (mm/min)
	N NOML	nominal value (mm/min)
Speed controller [1]	N INT	difference of nominal and actual for speed controller (mm/min)
Position	S ACTL	actual value (mm)
	S NOML	nominal value (mm)
Servo lag	S DIFF	servo lag for position control (mm)
Analogue voltage	U ANALOG	analogue voltage output (V)

[1] only for digital controlled driving axes

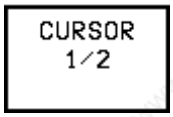
18.6.1 Soft Key Rows



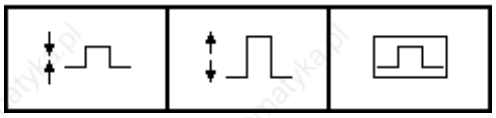
Explanation of the soft keys:

start recording

horizontal zoom



activate cursor



optimum vertical resolution, centered on screen

18.6.2 Trigger

The following possibilities are available:

- FREE RUN Recording is terminated by hand.
- SINGLE SHOT Recording of a memory contents; started by trigger condition
- CHANNEL ... Recording starts when the trigger threshold of the selected channel is exceeded.

Trigger Threshold

The trigger threshold for the selected channel is indicated as a numerical value; the units are as follows:
- feed rate (mm/min)
- position (mm)
- shaft speed (mm/min)
- servo lag (µm)
- analogue voltage (mV)

Edges

Triggering with rising (positive) and falling (negative) edge.

Pre-Trigger

Definition of recording start in % of the total recording time; possible entry values are 0%, 25%, 50%, 75%, 100%; selectable by pressing ENT.

18.6.3 Recording

The recording parameters to be edited are selected via arrow keys. The values for the feed rate threshold and the trigger threshold are entered via the numerical keys. The entry values for all other recording parameters are selected by pressing ENT.

Output

To output a nominal value in the MANUAL mode, it is possible to chose between a pre-set ramp and a jump function. The jump function (only possible with digital controlled axes) is required for the adjustment of the speed encoder. Moreover, if the preliminary entry value is unknown, the maximum acceleration can be determined from jump function and recording with the oscilloscope. In MDI and AUTOMATIC the axes are always accelerated following the selected ramp.

Feed Rate

If a jump function is selected as output signal, the feed rate is entered in mm/min. The programmed feed rate is valid for the acceleration subsequent to the ramp.

Time Resolution

The recording time is between 2.4576 seconds and 24.576 seconds (selected time x 4096). The selected time (0.6 ms to 6 ms) is the clock time for recording the characteristic lines. The recording time is displayed below the grating. Beginning and end of display (relative to the trigger point; cursor line T1) are displayed as well.

Channel 1 to Channel 4

Four channels can be selected for recording. The assignment of the axes to the channels is variable; select the axis to be changed, press ENT to switch the channel.

For each channel a characteristic line is selected. It consists of the following values:

Feed rate	V ACTL	actual value (mm/min)
	V NOML	nominal value (mm/min)
Shaft speed	N ACTL	actual value (mm/min)
	N NOML	nominal value (mm/min)
Speed controller	N INT	difference of nominal/actual value for the speed controller (mm/min)
Position	S ACTL	actual value (mm)
	S NOML	nominal value(mm)
Servo lag	S DIFF	servo lag for position controller (mm)
Analogue voltage	U ANALOG	analogue voltage output (V)
Channel	OFF	channel is displayed
	SAVED	channel is stored

Recording is started by pressing the START soft key. A soft key row is displayed which only contains a STOP key. The process can be interrupted at any time.
During recording the stored channels cannot be displayed simultaneously, since it is not possible to synchronise the stored channels and the newly recorded channels.

Evaluation of the recorded channels via cursor

Whereas the entire memory contents is displayed after start, the time window selected before the start is displayed after re-setup of the screen.
On the left side of the screen the time T1 (time of trigger event) is displayed. Below there is the absolute value in [mm/min], [mm] or [mV].
If an additional cursor with the time T2 is displayed by means of the key CURSOR 1/2, it can be shifted with the arrow keys on the TNC operating panel. The time T2 is the difference to T1; the numerical value displayed below is the difference to the value belonging to T1.
The T2 display and the additional cursor can be erased by pressing the soft key END or "Cursor 1/2".

Vertical Zoom

For the display of each selected channel the vertical grid can be changed in steps via soft key. The vertical grid size is displayed on the left side of the screen below the designations of the channel and the recording.

Centering the Display

The vertical resolution is selected such that an optimum display is ensured.

Returning to the original vertical resolution:
By pressing NOENT the original display of the stored data is re-established.

Horizontal Zoom

The recording comprises 4096 evaluated data. The time resolution (i.e. the clock time of the recorded data) can be set between 0.6 and 6 ms. The range for extension and compression is limited as follows:

	evaluated data	data: pixels
minimum display	4096	8 : 1
max. extended display	64	1 : 8

The length of the displayed detail and its starting point as absolute position within the duration of the recorded data is depicted as scroll bar in the status window.

19. PLC Inputs and Output

19.1 PLC Inputs

19.1.1 PLC Inputs on LE

Connector X42: I0 to I31 and acknowledgement "control ready for operation"
Connector X46: I128 to I152

"0" signal U_e = - 20V to 3.2V
I_e = 1.0mA with U_e = 3.2V

"1" signal U_e = 13V to 30.2V
I_e = 3.8mA to 8.9mA

19.1.2 PLC Inputs on PL 400

Terminal strips X4 to X9: I64 (I192) to I126 (I254)

"0" signal U_e = - 20V to 4V
I_e = 1.6mA with U_e = 4V

"1" signal U_e = 16.5V to 30V
I_e = 6.2mA to 12.6mA

19.1.3 PLC Inputs on PL 405/410

PL 405, terminal strips X3 to X4: I64 (I192) to I95 (I223)
PL 410, terminal strips X3 to X6: I64 (I192) to I127 (I255)

"0" signal U_e = - 20V to 4V
I_e = 1.6mA with U_e = 4V

"1" signal U_e = 16.5V to 30V
I_e = 6.2mA to 12.6mA

19.2 PLC Outputs

19.2.1 PLC Outputs on LE

Connector X41: O0 to O30 and output "control ready for operation"
Connector X46: O0 to O7 [1)]

[1)] outputs available at X46 or X41

"1" signal $U_{a\ min}$ = U_B - 3V
$I_{a\ NOML}$ = 0.1A

19.2.2 PLC Outputs on PL 400

Terminal strips X1 to X3: O32 (O64) to O62 (O94) and output "control ready for operation"

"1" signal $U_{a\ min}$ = U_B - 3V
$I_{a\ NOML}$ = 1.2A

19.2.3 PLC Outputs on PL 405/410

PL 405, terminal strip X8: O48 (O80) to O62 (O94) and output "control ready for operation"
PL 410, terminal strips X7 to X8: O32 (O64) to O47 (O79) and output "control ready for operation"

"1" signal $U_{a\ min}$ = U_B - 3V
$I_{a\ NOML}$ = 1.2A

Pin layout: see section 6

19.3 Checking the PLC Inputs and Outputs

The test unit (see section 20) can be used to check the PLC inputs and outputs on the logic unit (X41, X42, X46). The voltage level of the PLC inputs and the output current of the PLC outputs on the PL 400/405/410 can be measured directly at the terminals.

19.3.1 PLC Inputs

The PLC inputs can be checked as follows:

- Connect the test unit between LE and PLC (measure directly at the PL boards).

Press Key	Function
	TNC in operating mode PROGRAMMING/EDITING
MOD	Prepare TNC for input of code number
8 0 7 6 6 7 ENT	Enter code number, confirm with ENT
TABLE	Call TABLE function
INPUT	Display of input table

Now the logic states of the inputs are displayed on the screen. They must correspond to the voltage levels of the corresponding inputs (voltage levels: see section 19.1). If there is a difference and the input voltage is correct, the input board of the PLC graphics board or the PLC I/O board PL 400/405/410 is defective.

END	Exit the TABLE function
END	TNC in operating mode PROGRAMMING/EDITING

 **Observe the safety instructions!**

19.3.2 PLC Outputs

The PLC outputs can be checked as follows:
- Connect the test unit between the PLC and the LE (measure directly at the PL boards).

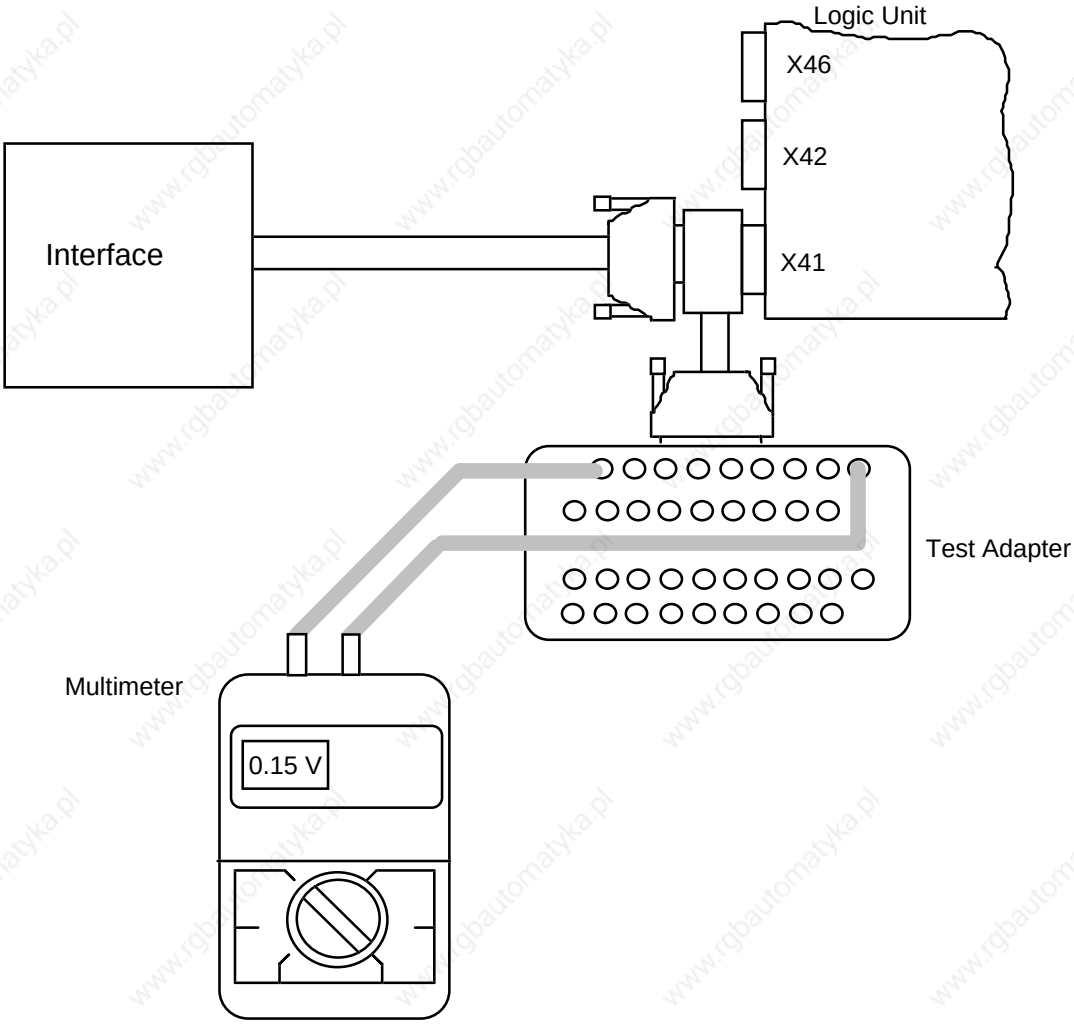
Press Key	Function
	TNC in operating mode PROGRAMMING/EDITING
MOD	Prepare TNC for input of code number
8 0 7 6 6 7 ENT	Enter code number, confirm with ENT
TABLE	Call TABLE function
OUTPUT	Display of output table

Now the logic states of the outputs are displayed on the screen. They must correspond to the voltage levels of the corresponding outputs. If there is a difference, check the output cable for short circuit and measure the output current at the interface (max. 100 mA for LE outputs, max. 1.2 A for PL outputs). If the output current is not exceeded and connecting cable is in order, the output board of the PLC graphics board or the PLC I/O board PL 400/405/410 is defective.

END	Exit the TABLE function
END	TNC in operating mode PROGRAMMING/EDITING

 **Observe the safety instructions!**

19.3.3 Measurement Setup for PLC Inputs and Outputs at the LE



X41 : PLC output
X42 : PLC input
X46 : machine operating panel

Observe the safety instructions!

19.4 Diagnosis Possibilities in the PLC Mode

19.4.1 TRACE Function

Activation via soft key 

MANUAL OPERATION

PLC PROGRAM TRACE MODE

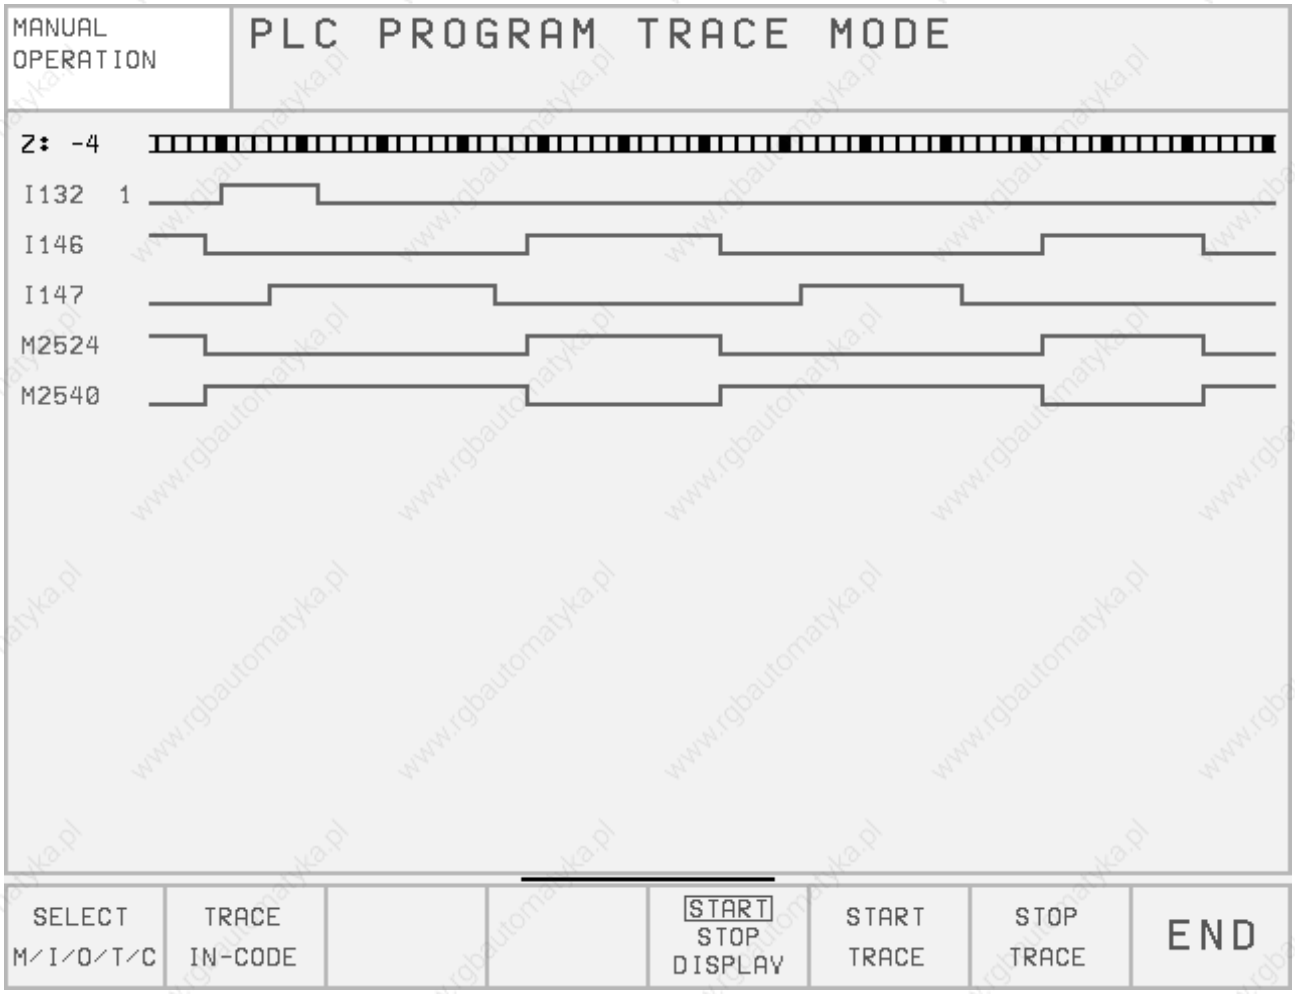
OPERAND	ACCU	ACTIVE	LINE	COMMAND	COMMENT
0	0	*	40	XON	M2207
0	0	*	41	=	M902
1	1	*	42	XO	I131
0	0	*	43	XON	M2207
0	0	*	44	=	M903
			45	; FREIGABEN DER WERKZEUGACHSEN	
0	0	*	46	A	M2000
0	0	*	47	=	O0
0	0	*	48	A	M2001
0	0	*	49	=	O1
0	0	*	50	A	M2002
0	0	*	51	=	O2
0	0	*	52	A	M2003
0	0	*	53	=	O3

SELECT M/I/O/T/C | LOGIC DIAGRAM | FIND | HEX ⇕ DECIMAL | START STOP DISPLAY | START TRACE | STOP TRACE | END

The TRACE function provides the possibility of controlling the logic states of the markers, inputs, outputs, timers and counters; it also serves to check the contents of bytes, words and double words of the compiled PLC program.

An instruction list (AWL) of the compiled program is displayed. In addition, the contents of the operand and of the accumulator is displayed in HEX code or decimal code. All active commands of the instruction list are marked by "*". Use the cursor keys or the GOTO function to display the requested program part.

19.4.2 LOGIC Diagram



The logic states of up to 16 operands (M, I, O, T, C) can be depicted simultaneously on the screen. 1024 PLC scans can be traced.

Activation of the Logic Diagram:

Press Key	Function
TRACE	Press soft key
LOGIC DIAGRAM	Press soft key

Selecting the Operands and Starting the Logic Diagram

Press Key	Function
SELECT M/I/O/T/C	

A table is displayed from which the operands can be selected. The control requests the positions of the table in a dialogue. Wrong inputs can be cleared by pressing DEL. It is possible to enter a trigger condition for each operand. 512 states are traced before and after a trigger event. The following trigger conditions are possible:

"1" ⇒ trace if the operand is a logical "1"
(trigger on positive edge)

"0" ⇒ trace if the operand is a logical "0"
(trigger on negative edge)

NO ENT ⇒ no trigger
If no trigger condition is entered for any of the operands, the operand states are traced continuously and the last 1024 states are stored.

e.g.: 0 I5 1 ⇒ trigger on positive edge
1 O6 0 ⇒ trigger on negative edge
2 M2003 ⇒ no trigger

START TRACE	Start TRACE function
	TNC in operating mode "MACHINE" (key on VDU)

The trace function is started with START TRACE; END TRACE or a trigger event terminate the tracing.

PCTR blinking : trigger condition has not occurred yet
PCTR on : trigger condition has occurred; write access to buffer memory
PCTR off : buffer memory is full; LOGIC DIAGRAM can be called

	Switch to TRACE mode
LOGIC DIAGRAM	Call logic diagram

19.4.3 TABLE Function

Press Key	Function
TABLE	Call TABLE function

SET	RESET	MARKER	INPUT	OUTPUT	COUNTER	TIMER	END

Press Key	Function
▷	Key on VDU

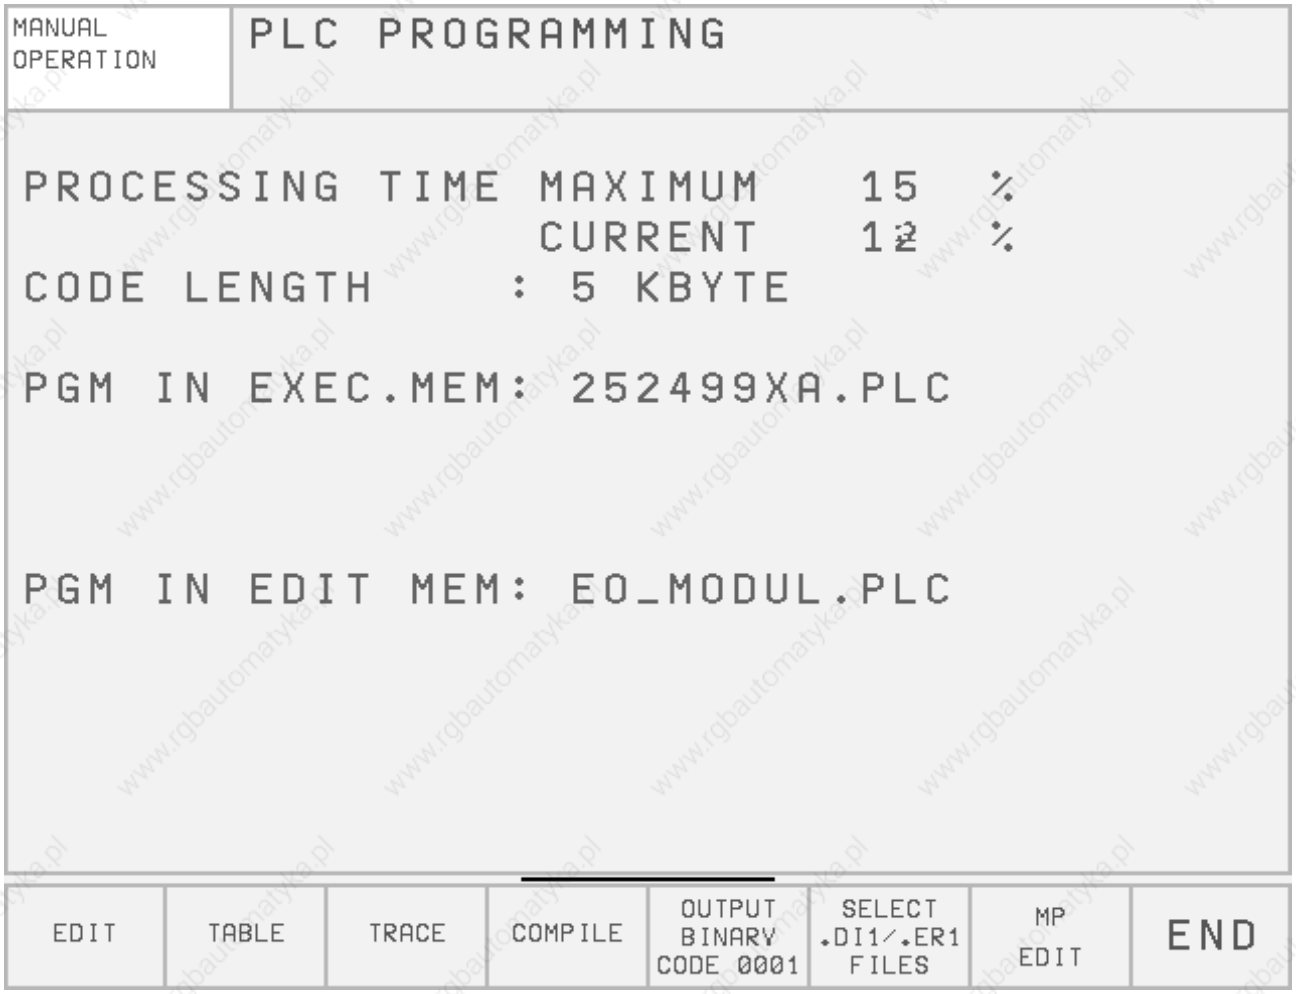
BYTE	WORD	DOUBLE	HEX ⇕ DECIMAL				END

After pressing a soft key, the corresponding table is activated.
The logic states of the markers, inputs, outputs, counters and timers are dynamically displayed.
In the tables for bytes, words and double words, the display can be switched between HEX and DECIMAL.

With the cursor keys or the GOTO key, positions of a table can be selected.

Notes

19.5 Compiling the PLC Program



Selecting a File as EDITOR PGM:

Press Key	Function
PGM NAME	Call file overview
SELECT	Select desired program

The file is no in the **editor** and can be called any time by pressing the soft key EDIT.

Loading <NAME.PLC> into the Process Memory:

COMPILE	Press soft key
SELECT	Press soft key

The selected PLC PGM is compiled and loaded into the process memory.

19.6 Output "Control Ready for Operation" and Acknowledgement for Test " Control Ready for Operation "

Important functions are monitored by the TNC 415B/425 by way of a self-diagnosis system (electronic assemblies such as micro-processor, EPROM, RAM, positioning systems, encoders etc.).

If an error is detected, a blinking error message in plain language is displayed in the dialogue line. As soon as this error message is generated, the control opens the output "Control Ready for Operation".

The output "Control Ready for Operation" is available via:

Logic unit,	connector X41	pin 34
PL 400,	terminal strip X3	pin 10
PL 405,	terminal strip X8	pin 16
PL 410,	terminal strip X8	pin 16

By switching off the power switch or by pressing 

this state can be cancelled, provided that the error cause has been eliminated.

The output "Control Ready for Operation" is to switch off the +24V control voltage in the machine tool interface. Since this is an important safety function, the switch-off function of the output "Control Ready for Operation" is tested via the input "Acknowledgement Control Ready for Operation" each time the control is switched on.

TNC 415B/425 features three monitoring systems (main processor, geometry processor and CLP processor) which are also tested when the machine tool is switched on.

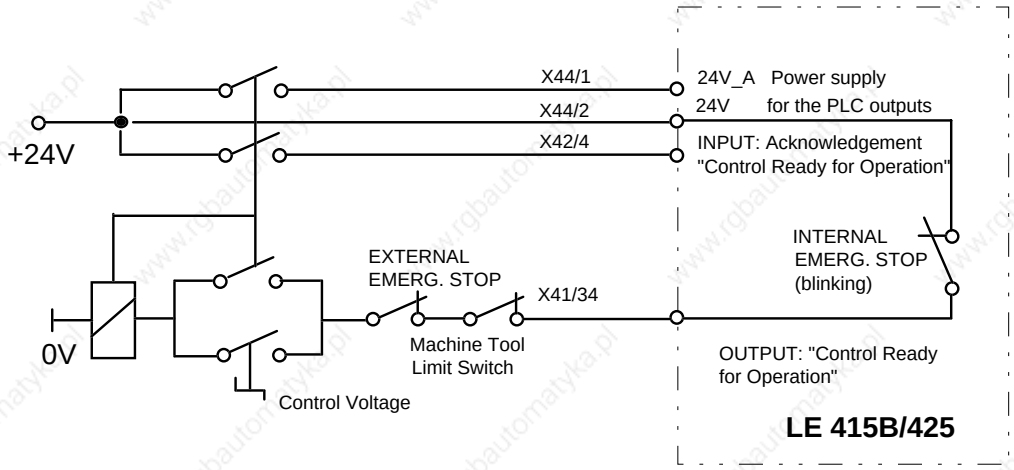
If the +24V at the input "Acknowledgement Control Ready for Operation" are missing during the test routine after power-on, the error message " RELAY EXT. DC VOLTAGE MISSING" is displayed. If however, the acknowledgement is switched off too late (or not at all) after the output has been switched off, the blinking error message "EMERGENCY STOP DEFECTIVE" is generated. This error message is also displayed, if the power supply of the PLC is missing (power supply of the PLC: see section 10).

If the control detects an error during the power-on test routine, a bridge can be inserted between the output "Control Ready for Operation" and the input "Acknowledgement Control Ready for Operation" (disconnect the wires) in order to determine whether the defect is due to the control or to the interface. If the error is still present after inserting the bridge and with correct PLC power supply, the defect is located in the logic unit. If however, the error does not occur with the bridge being inserted, the defect is located in the interface.

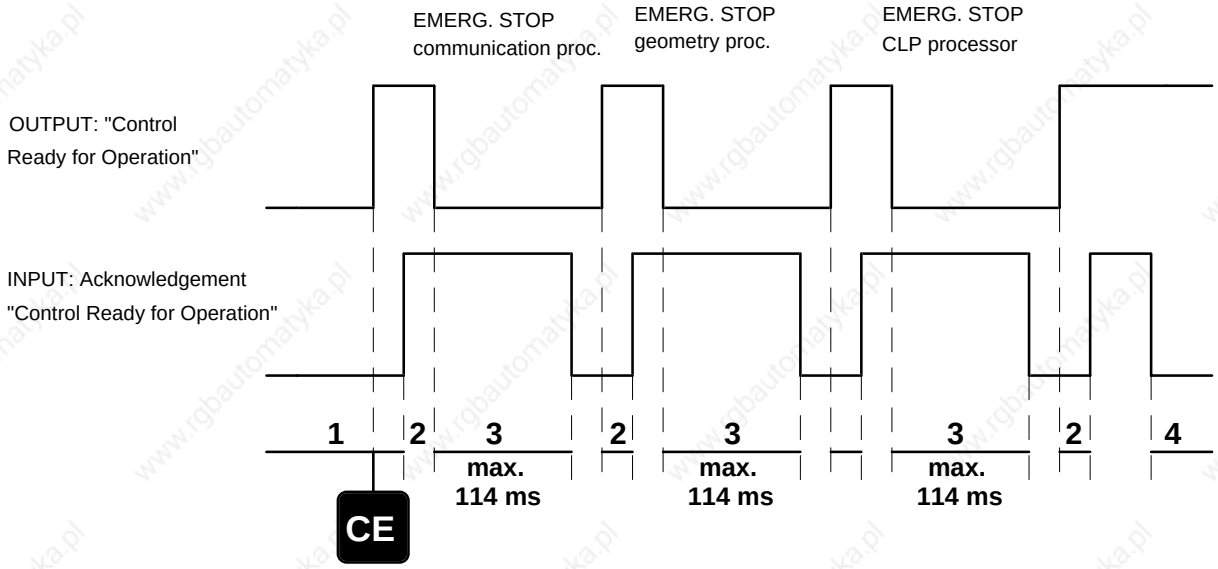
Warning!
Do not forget to remove the bridge and to install the standard operating state after the test.

Observe the safety instructions!

19.6.1 Wiring of the EMERGENCY STOP Interface



19.6.2 TNC 415B/425 Flow Diagram



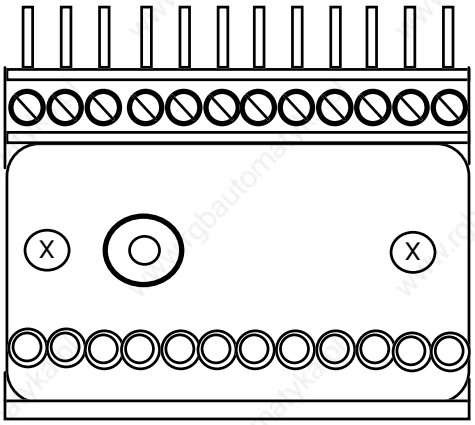
Time	Remarks	Error Message
1		**POWER INTERRUPTED**
2	Waiting for control voltage	**RELAY EXT. DC VOLTAGE MISSING**
3	After switching off the output "Control Ready for Operation", the "Acknowledgement Control Ready for Operation" must be switched off within 114 ms; otherwise the blinking error message is generated.	**EMERGENCY STOP DEFECTIVE YX** YX = 1(= Communication processor 1) = Geometry processor 1. = CLP processor
4	If the acknowledgement is switched off during operation, the error message is displayed.	**EMERGENCY STOP**

20. Test Units

20.1 Test Unit for the PLC Inputs and Outputs

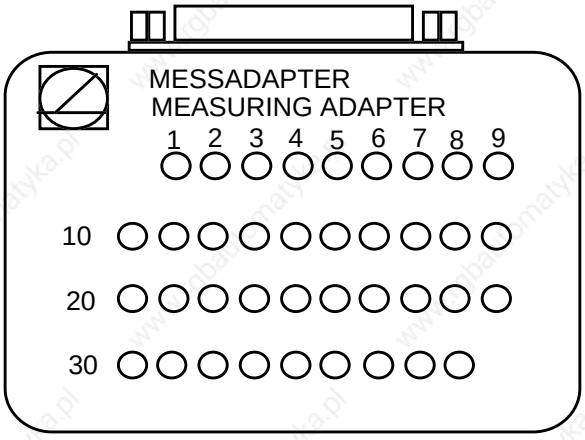
PL Test Unit, Id.No. 247 359 01

to test the PLC inputs and outputs on PL 400

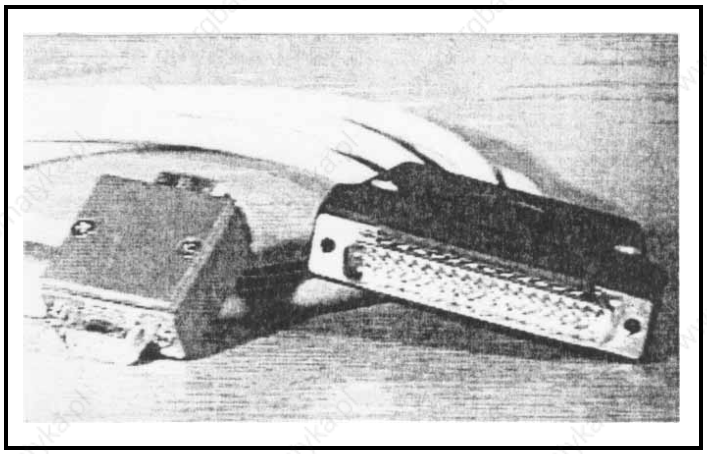


20.2 Universal Measuring Adapter

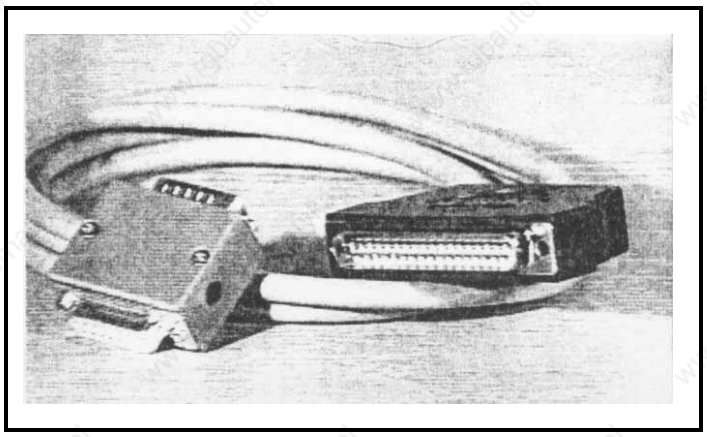
Used:
as universal test unit for D-Sub connectors, 9-pin to 37-pin (Id.No. 255 480 01)



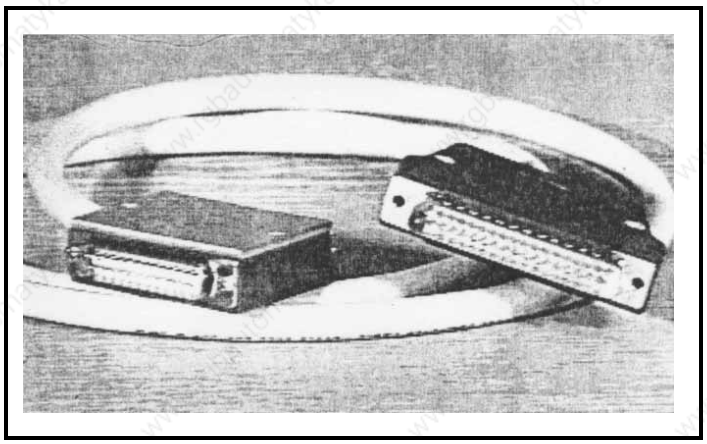
The measuring adapter can be used to test the inputs and outputs of D-Sub connectors (9-pin to 37-pin).
On the following page the adapter cables are shown that are required for the different connectors.



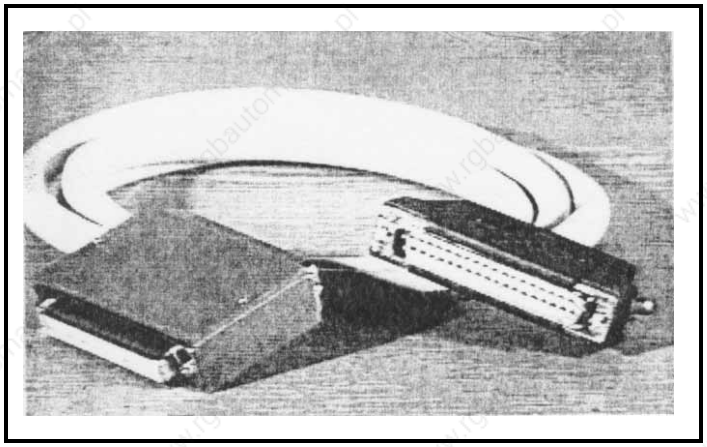
Adaptor Cable,9pin
Id.No. 255 481 01



Adaptor Cable, 15pin
Id.No. 255 482 01



Adaptor Cable, 25pin
Id.No. 255 483 01



Adaptor Cable, 37pin
Id.No. 255 484 01

20.3 Encoder Diagnostic Set, Id.No. 254 599 01

Used:
to test the electrical functions of an encoder
(Further information please see from the operating instructions of the Diagnostic Set.)

21. Exchange Instructions

21.1 Important Notes

Observe the safety instructions!

21.1.1 Required Equipment

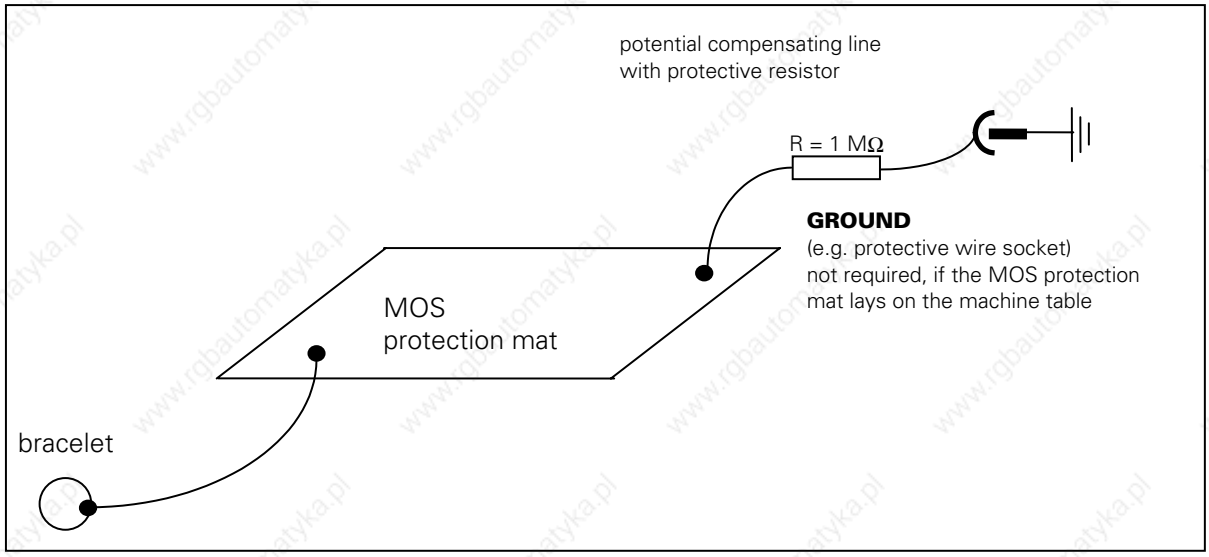
1 external data medium, e.g. FE 401/B or PC with connecting cable
1 tool set (screw driver, socket wrench etc.)
1 MOS protection device (only required for exchanging boards or EPROMs)

21.1.2 MOS Protection

If the processor board, the PLC graphics board, the CLP boards or EPROMs are to be exchanged, a MOS protection is definitely required, since otherwise MOS components on the boards or the EPROMs may be destroyed.

Caution!
Avoid any unprotected handling of the boards or EPROMs with statically charged objects (packaging material, storage etc.).

MOS Protection



21.1.3 Software Compatibility

Exchange units (LOGIC UNIT) are always supplied with the most recent software version. Exchange boards, however, are delivered **without** software and without software enable module. Therefore, the EPROMs and the software enable module of the defective board must be inserted into the exchange board at site. Always remove the EPROMs and the software enable module before sending us boards for repair!)

21.1.4 Backing up RAM Data

Before the LOGIC UNIT, an assembly (e.g. processor board, power supply etc.) or the NC software are exchanged, all RAM data (files, settings etc.) must be backed up.

The following files may be stored in RAM and must be backed up on a external data medium:

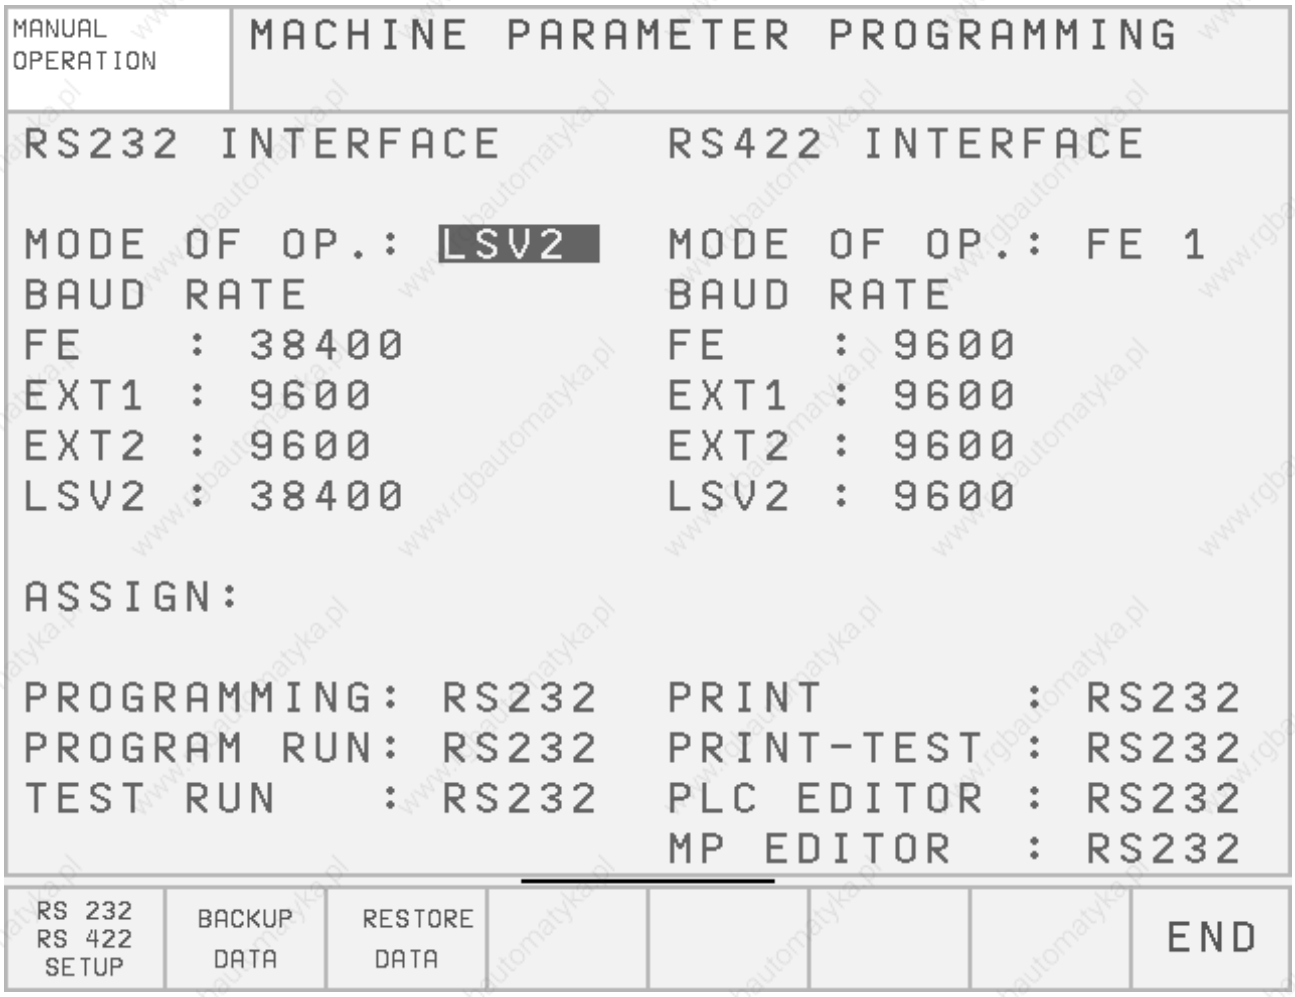
NC memory management	**Extension in TNC**	**Extension on external medium**
NC program, HEIDENHAIN dialogue	.H	.H
NC program, ISO	.I	.I
Active tool table	TOOL.T	TOOL.T
Tool data (table)	.T	.T
Pocket table		TOOL_P.R
Pallet table	.P	.L
Datum table	.D	.N
Text file (ASCII)	.A	.A
Point table (digitizing)	.PNT	.U
PLC memory management (RAM)		
PLC program	.PLC	.P
Error messages 1. language	.ER1	.A
Error messages English	.ERE	.A
Dialogues 1. language	.DI1	.A
Dialogues English	.DIE	.A
ASCII files	.A	.A
Help texts	.HLP	.J
Data for axis error compensation	.COM	.V
Data for axis error compensation	.CMA	.S
Machine parameter mode		
Machine parameter list	.MP	.M
Compensation value table (accessible via code number)	.KOR	.S

Letters representing additional information on the files and programs are displayed in the status display:

E: The file or the program was selected in PROGRAMMING.
S: The file or the program was selected and activated in TEST RUN.
M: The file or the program was selected and activated in PROGRAM RUN/FULL SEQUENCE or in PROGRAM RUN/SINGLE BLOCK.
P: The file or the program is protected against deleting and editing.
IN: The file or the program was programmed in inches.
W: The file or the program was not completely transferred to the external medium and thus is no longer available.

The data can be read out as described in section 17.3.
The **BACKUP routine** is a very useful function to read out all data.
After pressing MOD in the operating mode "Machine Parameter Editing" (code number 95148) the menu for interface configuration is displayed, comprising the soft keys

BACKUP DATA	and	RESTORE DATA



With BACKUP DATA all operating parameters and the data of all file types are transferred via the data interface and filed in $BACKUP.A. To reload the data into the TNC, press the soft key RESTORE DATA.

Moreover, the pre-set values and the entry values for the supplementary operating modes must be determined so that they can be re-entered after the exchange.

Switch off and on the main switch of the machine tool.

21.1.5 Labelling the Connecting Cables

If the connecting cables are labelled incompletely or not at all, they have to be marked such that the correct plug connections can be re-established after having exchanged the logic unit or another assembly.
Pin layout: see section 6

WARNING:
Switching the connecting cables may destroy the unit!

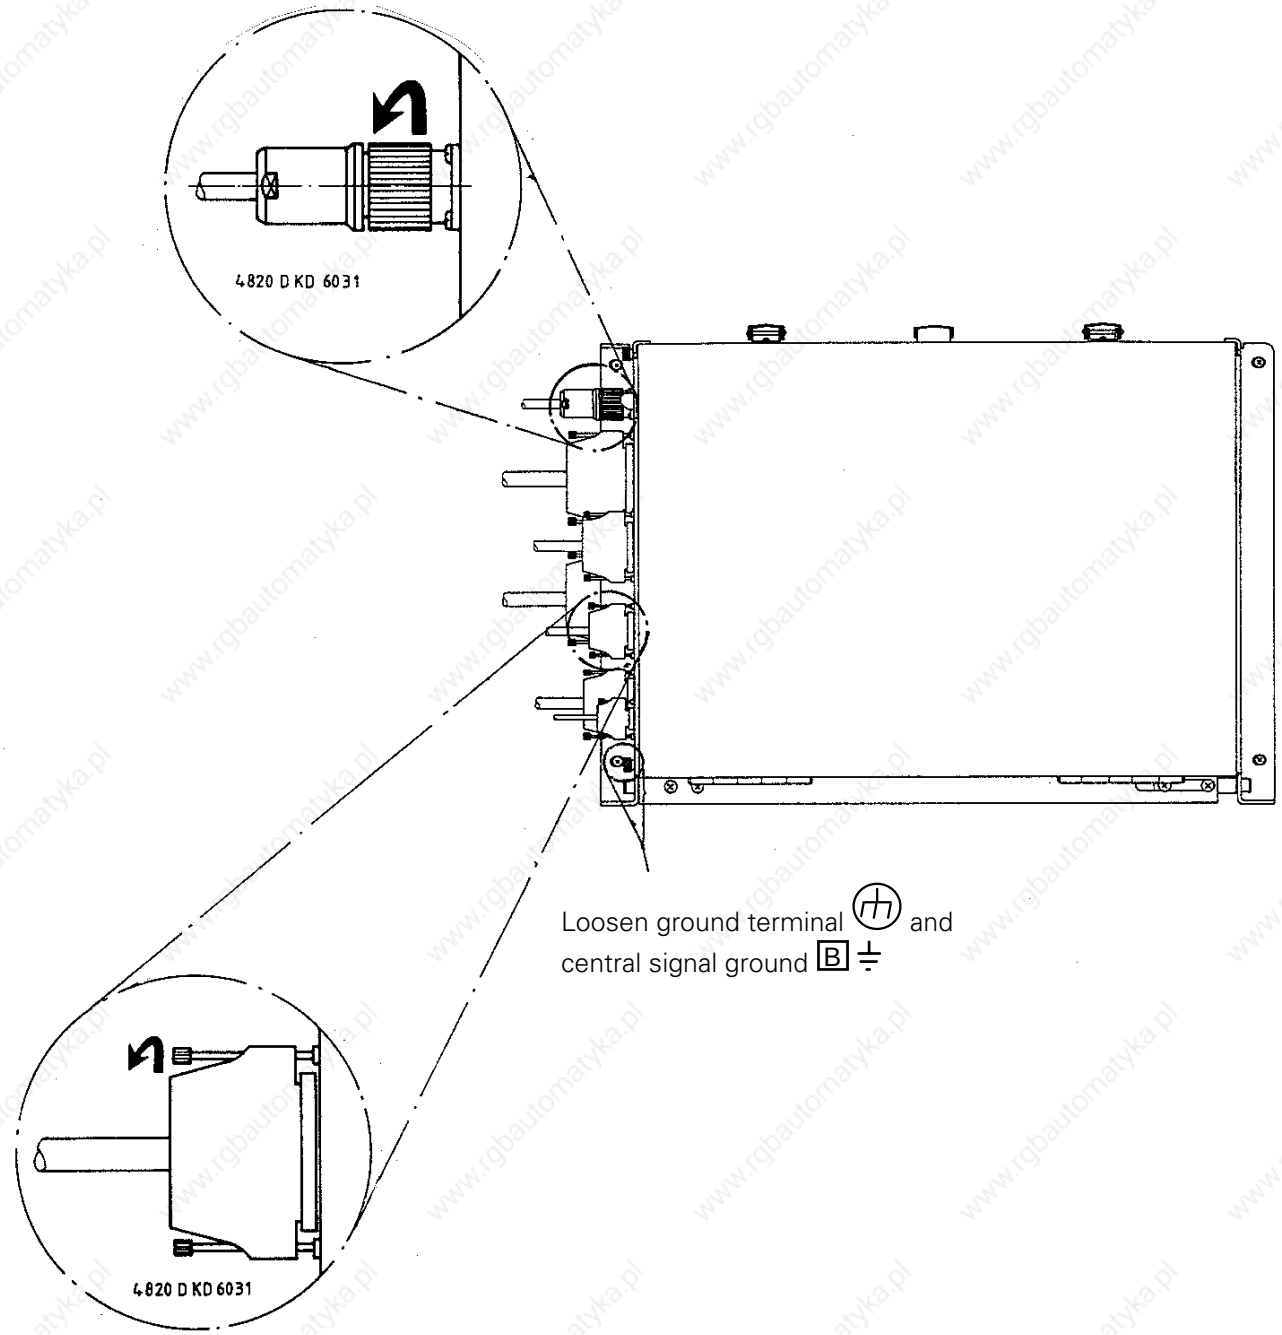
21.2 Exchanging the Logic Unit

21.2.1 Observe the exchange instructions (section 21.1) !

21.2.2 Dismounting the Logic Unit

a) Switch off the main switch.
b) Loosen all plug connections and clamped joints at the logic unit.

Round connector
Loosen knurled coupling rings (TNC 415B/F only)

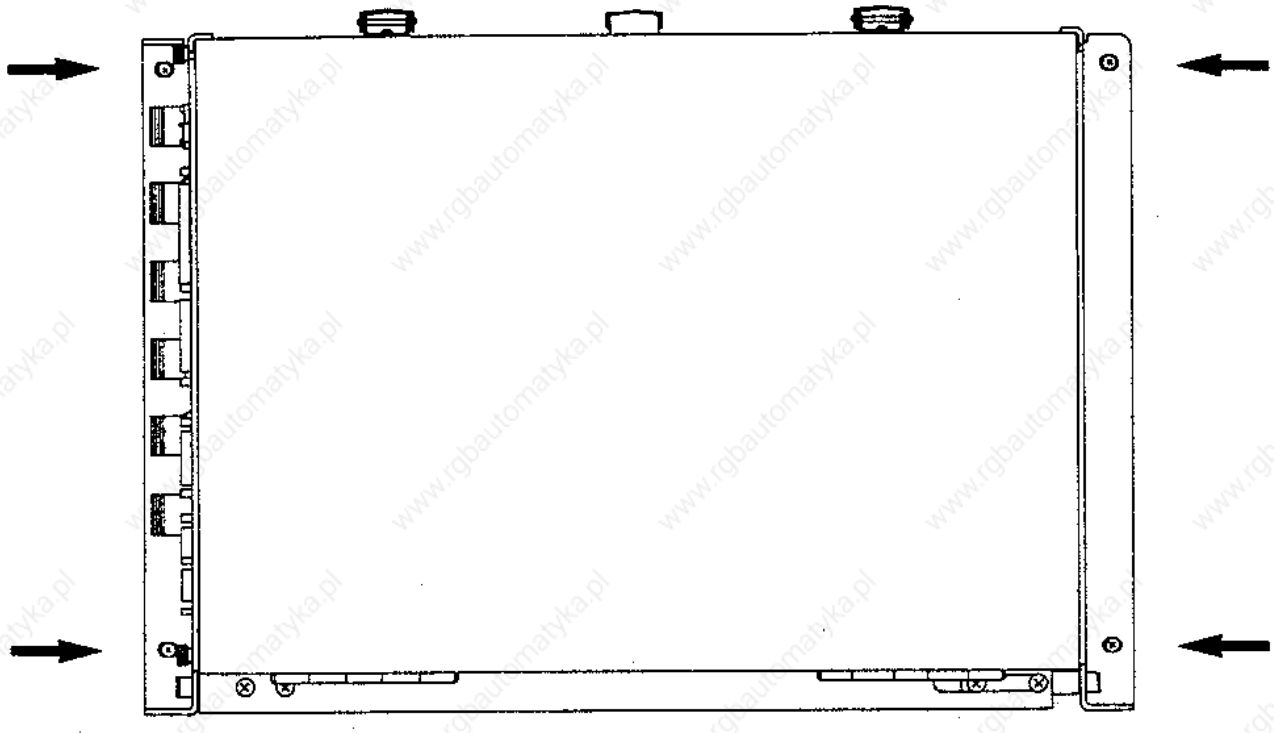


Loosen ground terminal ⏚ and
central signal ground B ⏚

D-Sub connector
Loosen knurled screws

NOTE:
If a PL400/410 is mounted on the upper side of the housing, it must be removed before dismounting the logic unit.

c) Loosen the 4 mounting screws on the logic unit



d) Remove the old logic unit and insert the new logic unit.

21.2.3 Mounting the Logic Unit

The logic unit is mounted in the reverse order that is was dismounted.

a) Insert and secure the logic unit.
b) Engage the connectors.

Observe that no connectors are switched!

c) Switch on the main switch.
d) Read in the machine tool data (machine parameters, PLC program, NC programs and tables) that have been backed up before the exchange.
e) Enter the pre-set values and the supplementary operating modes from the table in section 21.1.4 (**before** traversing the reference marks).
f) Offset adjustment with code number (see section 18.5).

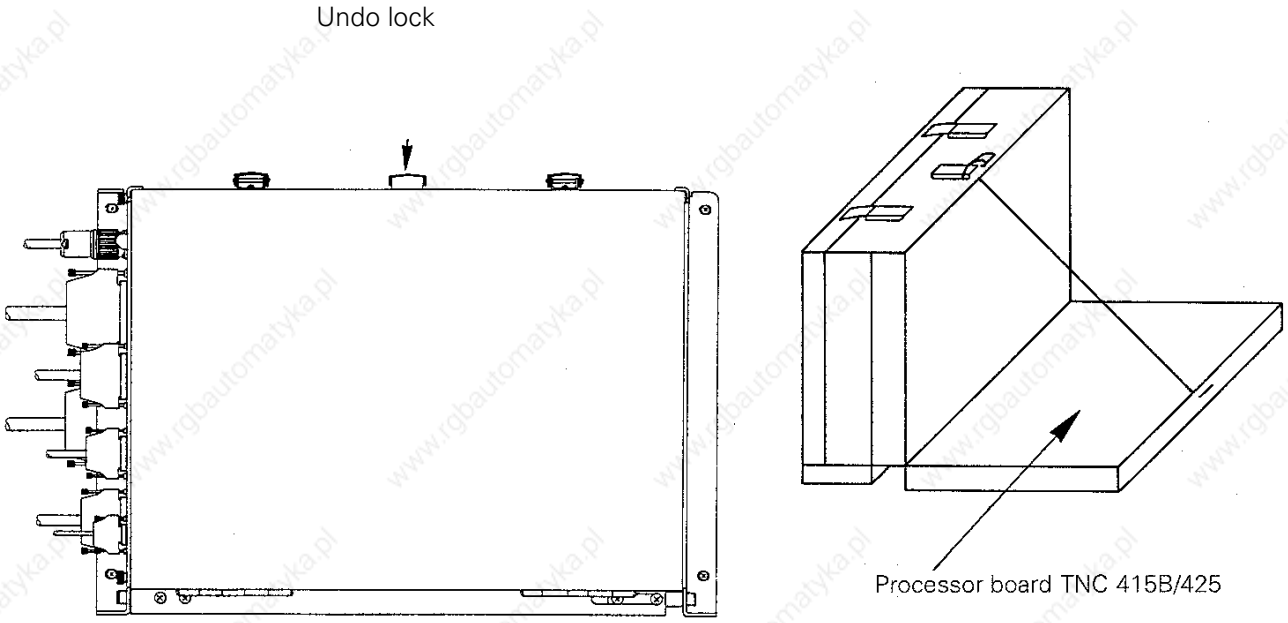
Exchange is now finished.

21.3 Exchanging the Processor Board

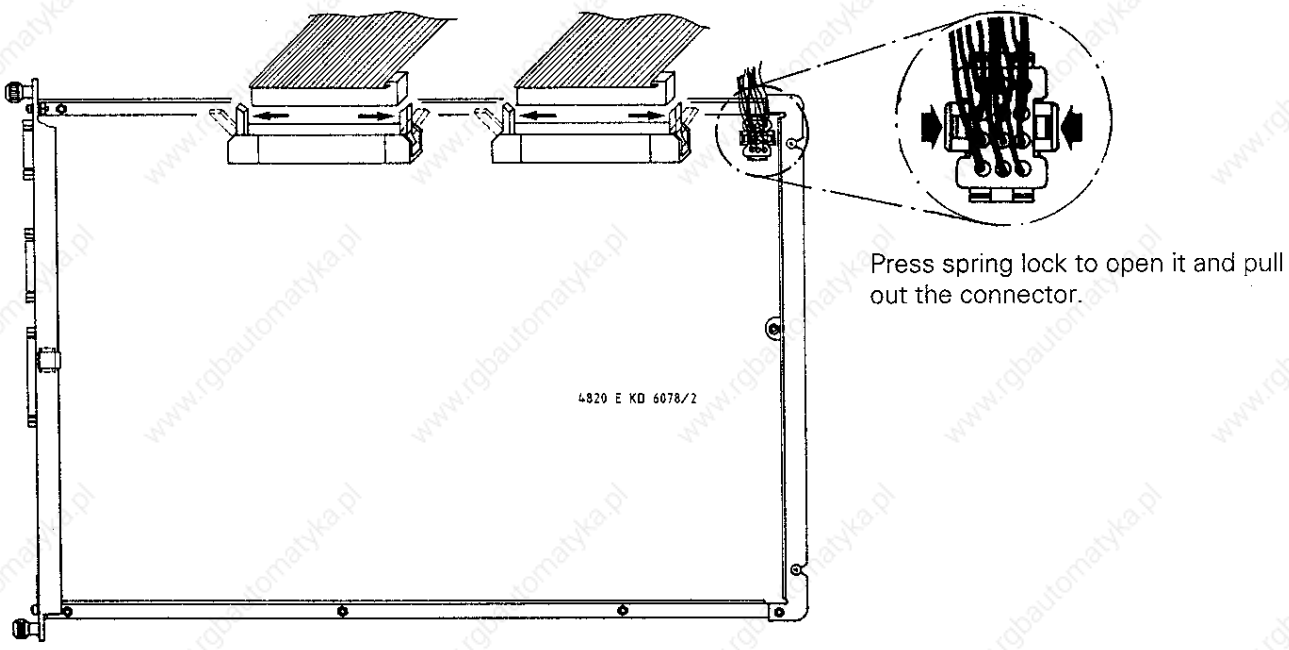
21.3.1 Observe the exchange instructions (section 21.1)!

21.3.2 Dismounting the Processor Board

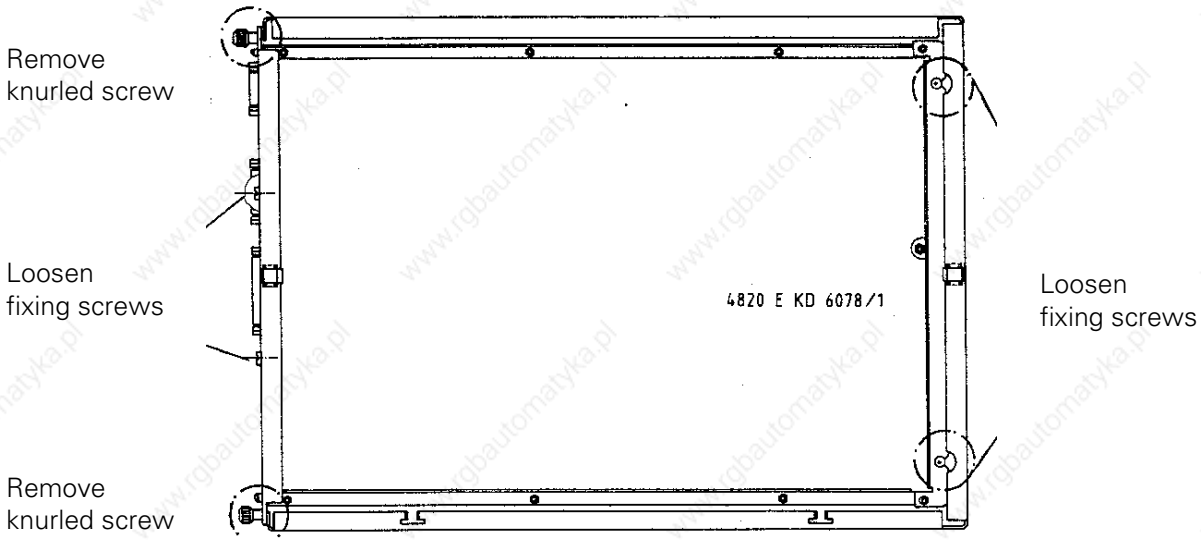
a) Switch off the main switch on the machine tool.
b) Disengage the connectors on the processor board (X21, X22, X23).
c) Undo the lock and open the logic unit.



d) Disengage internal connectors



e) Loosen/remove fixing screws



f) Lift out the processor board; exchange the EPROMs, if required (see section 21.8). Insert the new board.

21.3.3 Mounting the Processor Board

The processor board is mounted in the reverse order that is was dismounted.

a) Insert and secure the processor board.
b) Engage the connectors.

Observe that no connectors are switched!

c) Close the logic unit and the lock.
d) Switch on the main switch.
e) Read in the machine data (machine parameters, PLC program, NC programs and tables) that have been backed up before the exchange.
f) Enter the pre-set values and the supplementary operating modes from the table in section 21.1.4 (**before** traversing the reference marks).
g) Offset adjustment with code number (see section 18.5).

Exchange is now finished.

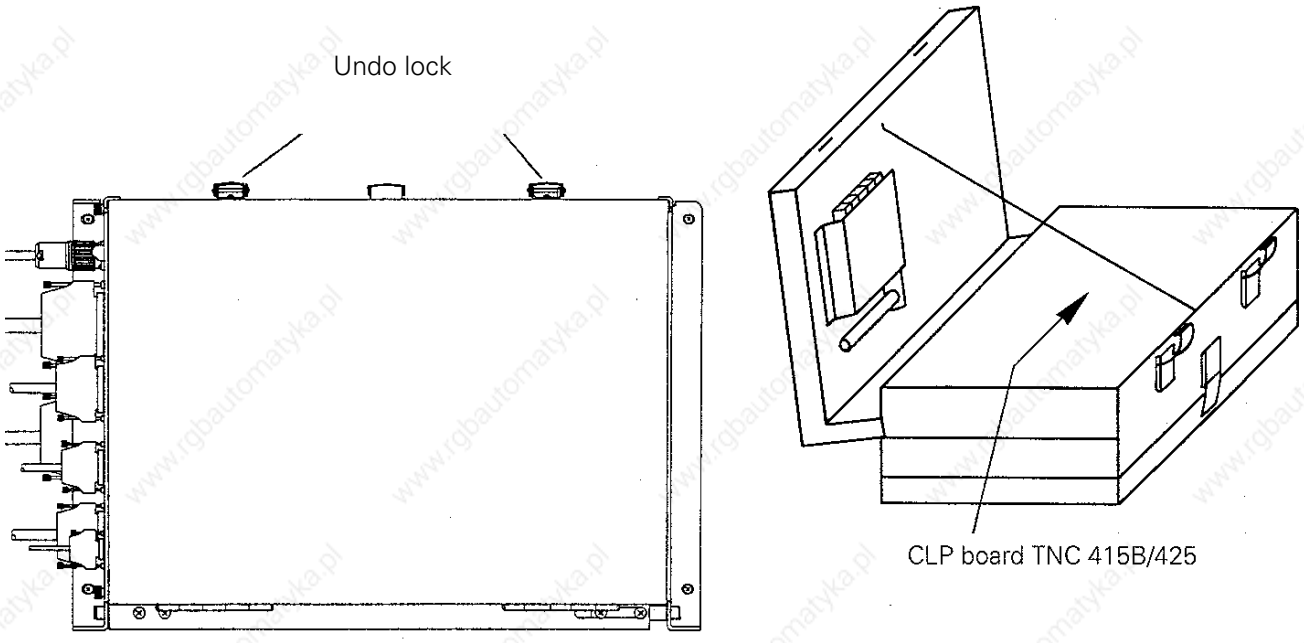
Warning!
Send and store the boards **only** in the **original packaging** that protects them from acquiring static charge. Never use conventional plastics to wrap the boards in.

21.4 Exchanging the CLP Board

21.4.1 Observe the exchange instructions (section 21.1)!

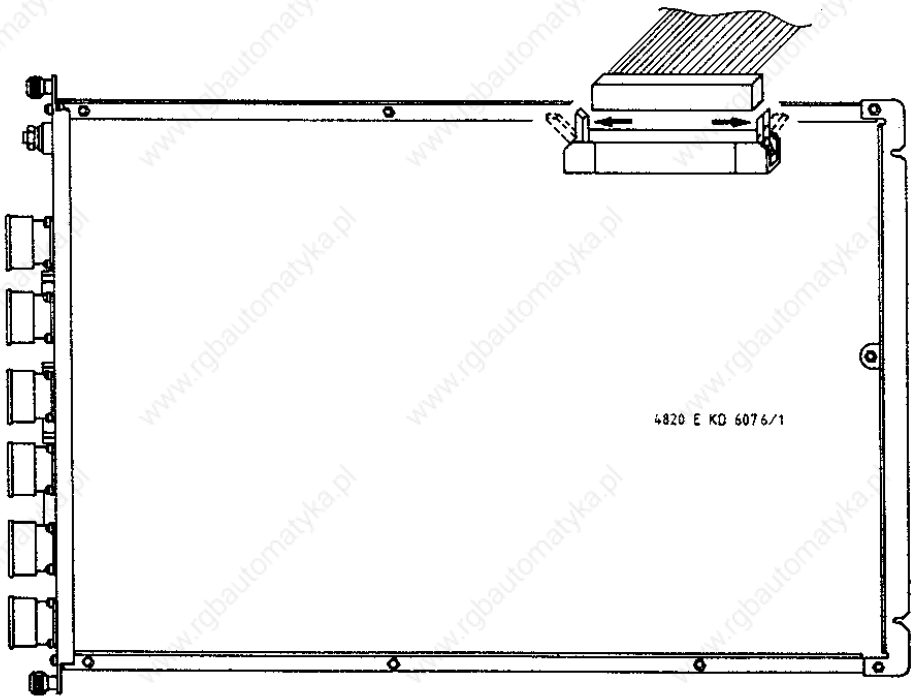
21.4.2 Dismounting the CLP Board

a) Switch off the main switch at the machine tool.
b) Disengage the connectors at the CLP board.
c) Undo the locks and open the logic unit.

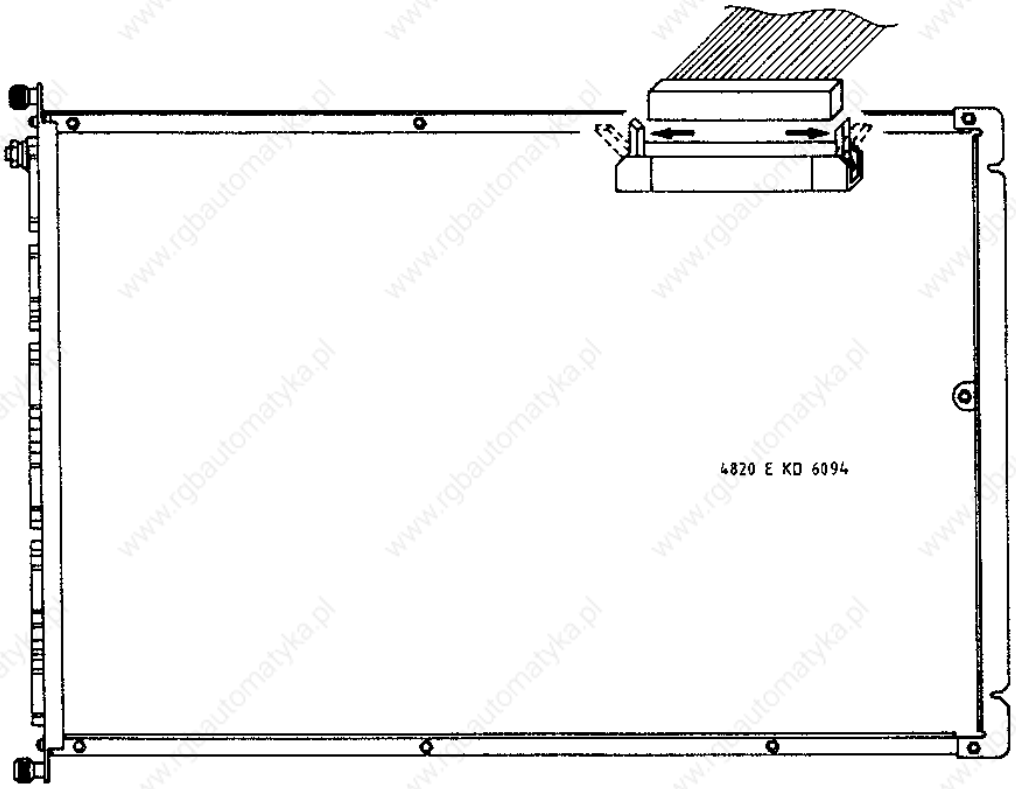


d) Disengage internal connectors

CLP board TNC 415B

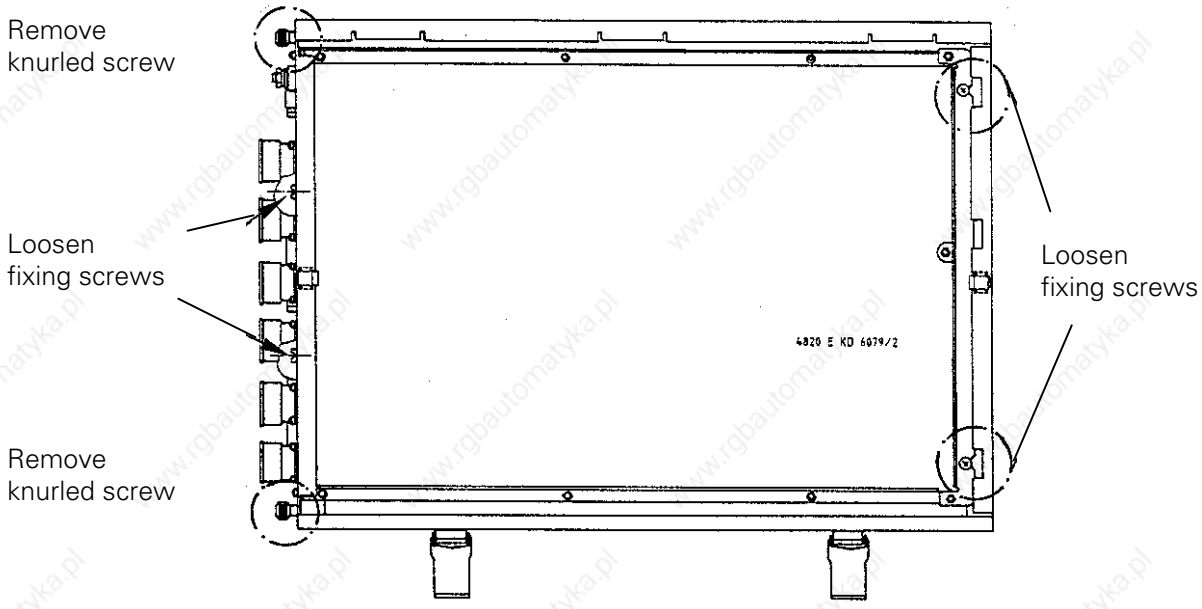


CLP board TNC 425

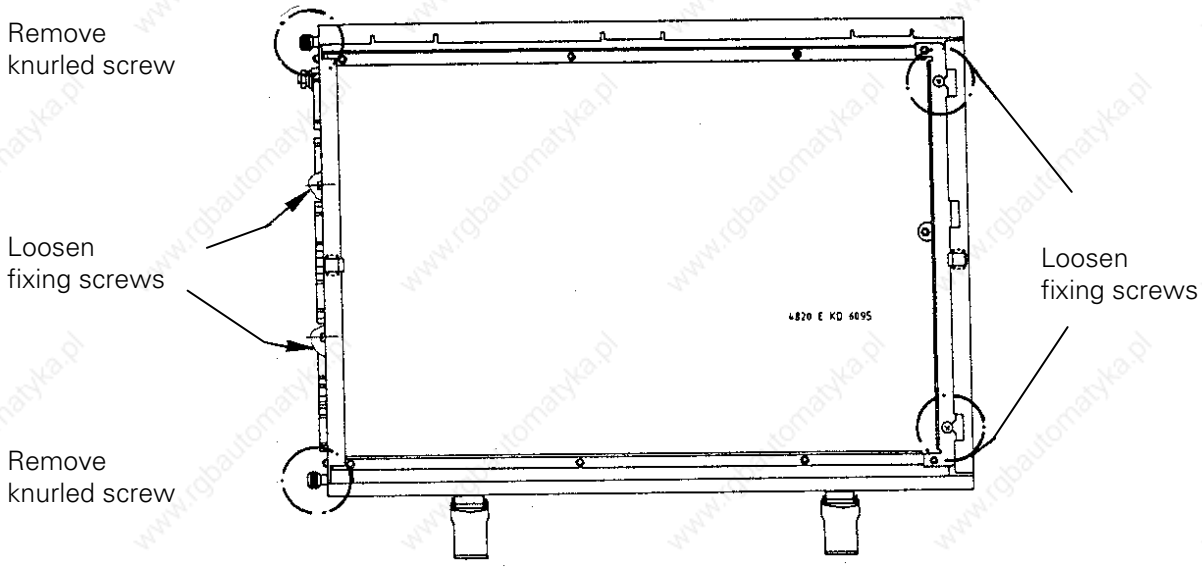


e) Loosen/remove the fixing screws.

CLP board TNC 415B



CLP board TNC 425



f) Lift out the CLP board; exchange the EPROM, if required (see section 21.8).
Insert the new board.

21.4.3 Mounting the CLP Board

The CLP board is mounted in the reverse order that is was dismounted.

a) Insert and secure the CLP board.
b) Engage the connectors.

Observe that no connectors are switched!

c) Close the logic unit and the locks.
d) Switch on the main switch.
e) Offset adjustment with code number (see section 18.5).

Exchange is now finished.

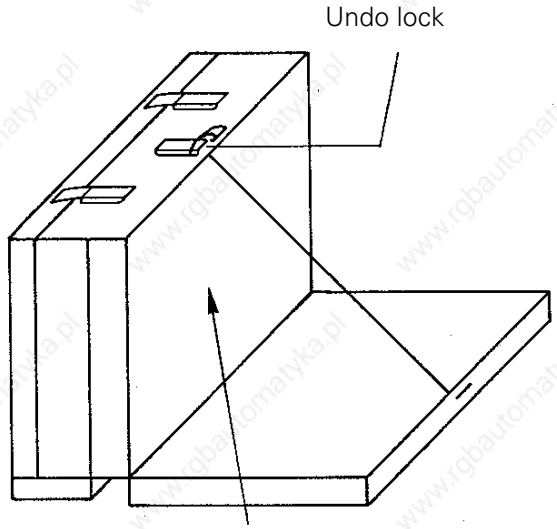
Warning!
Send and store the boards **only** in the **original packaging** that protects them from acquiring static charge. Never use conventional plastics to wrap the boards in.

21.5 Exchanging the PLC Graphics Board

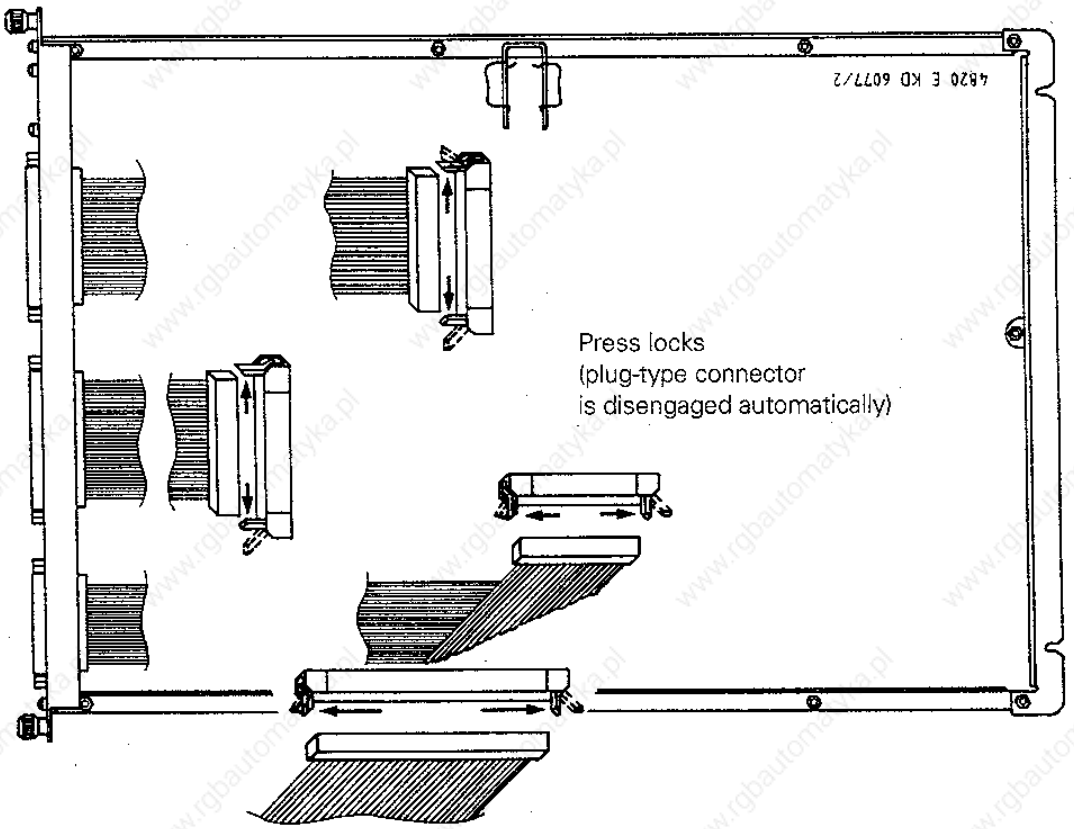
21.5.1 Observe the exchange instructions in section 21.1!

21.5.2 Dismounting the PLC Graphics Board

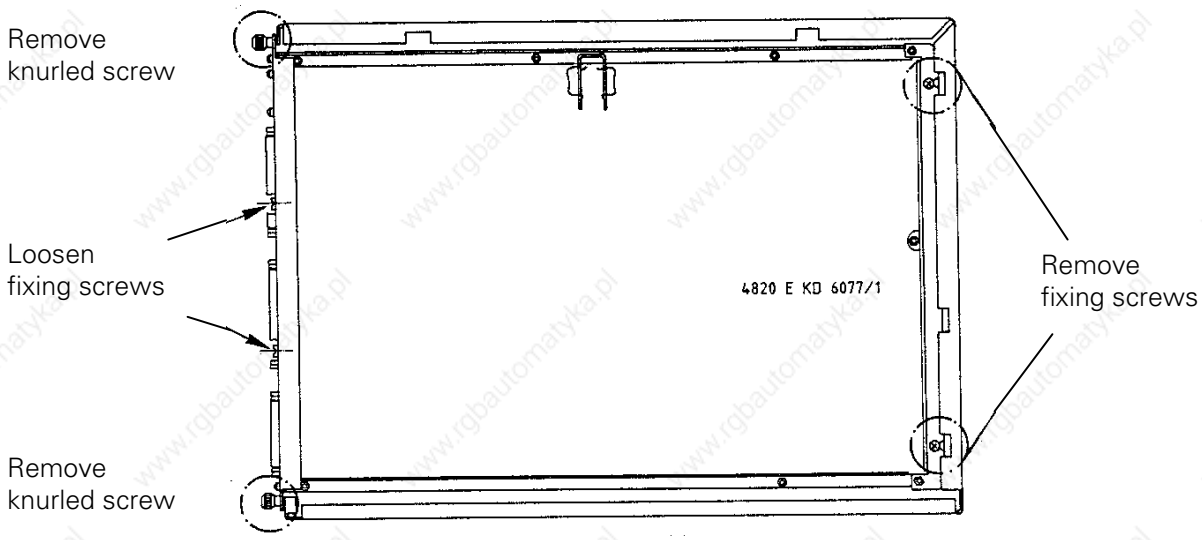
a) Switch off the main switch of the machine tool.
b) Disengage the connectors on the PLC graphics board.
c) Undo the lock and open the logic unit.



d) Disengage internal connectors.



e) Loosen/remove fixing screws



f) Lift out the PLC graphics board and insert the new board.

21.5.3 Mounting the PLC Graphics Board

The PLC graphics board is mounted in the reverse order that it was dismounted.

a) Insert and secure the PLC graphics board.
b) Engage the connectors.

Observe that no connectors are switched!

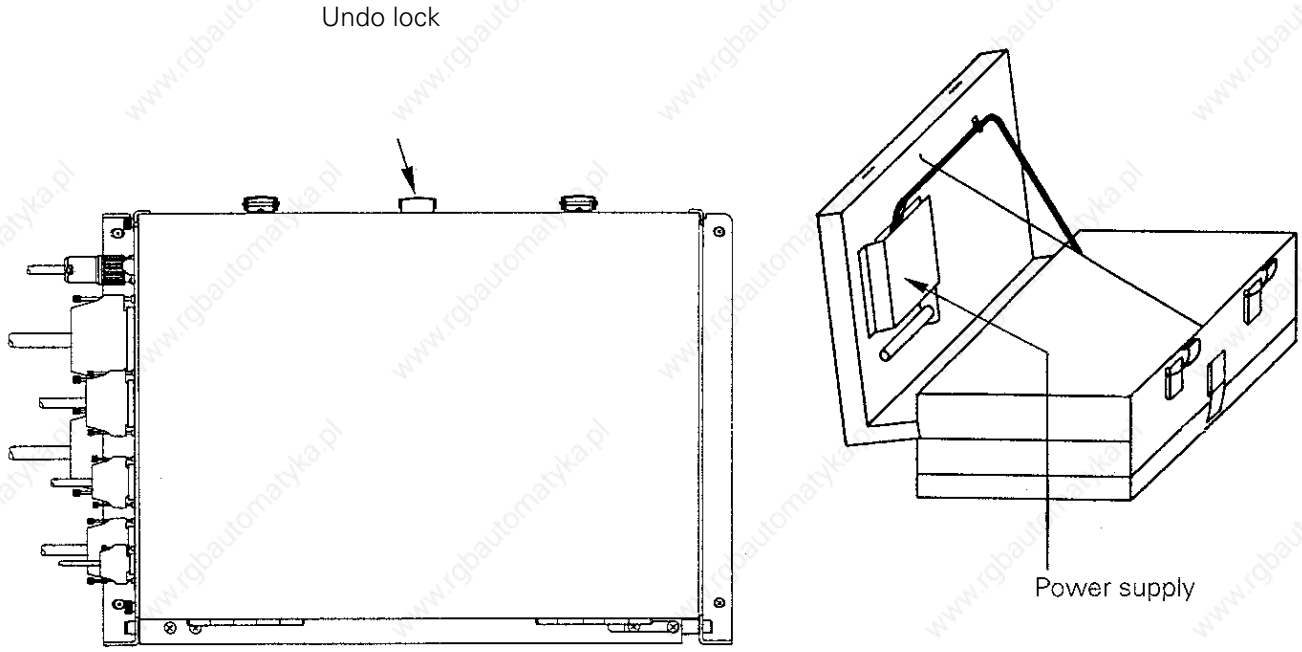
c) Close the logic unit and the lock.
d) Switch on the main switch.
e) Carry out offset adjustment with code number (see section 18.5).

Exchange is now finished.

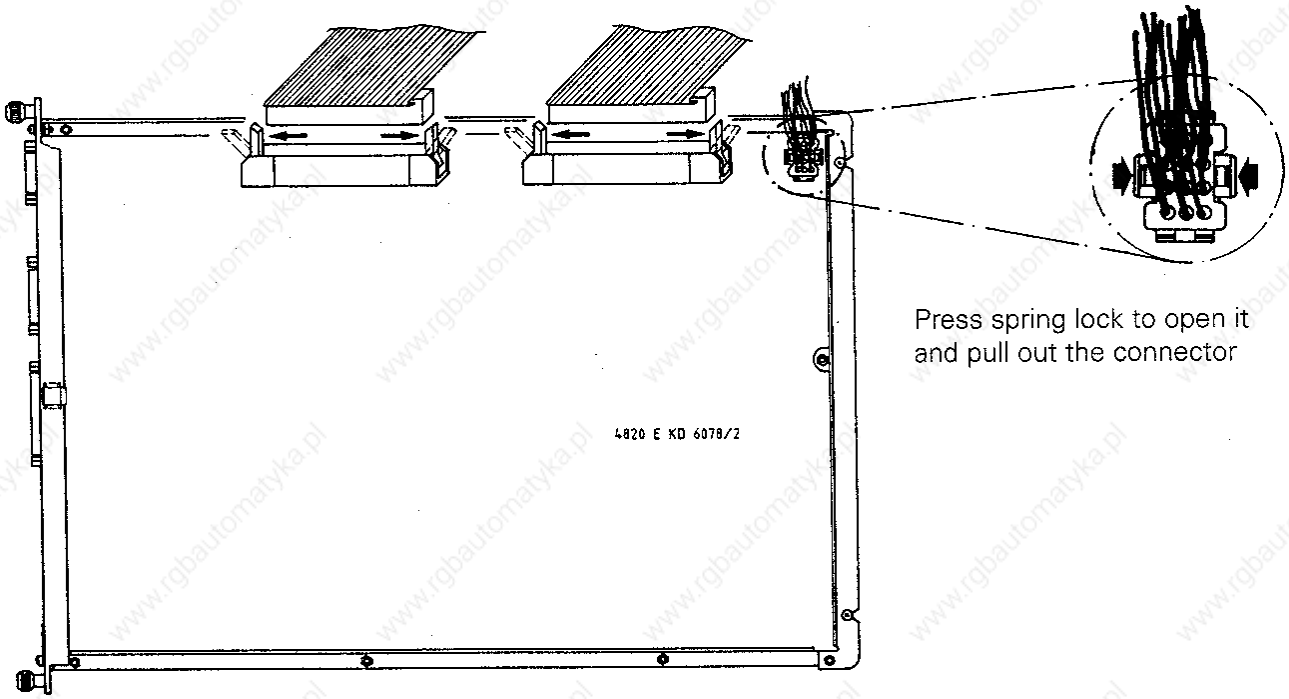
Warning!
Send and store the boards **only** in the **original packaging material** that protects them from acquiring static charge. Never use conventional plastics to wrap the boards in.

21.6 Exchanging the POWER SUPPLY Unit

a) **Observe the exchange instructions in section 21.1!**
b) Switch off the main switch on the machine tool.
c) Undo the lock and open the logic unit.



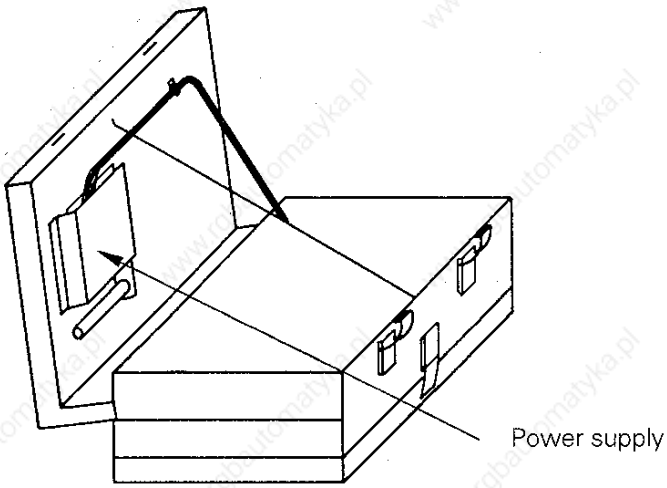
d) Disengage the connection to the power supply unit at the processor board.

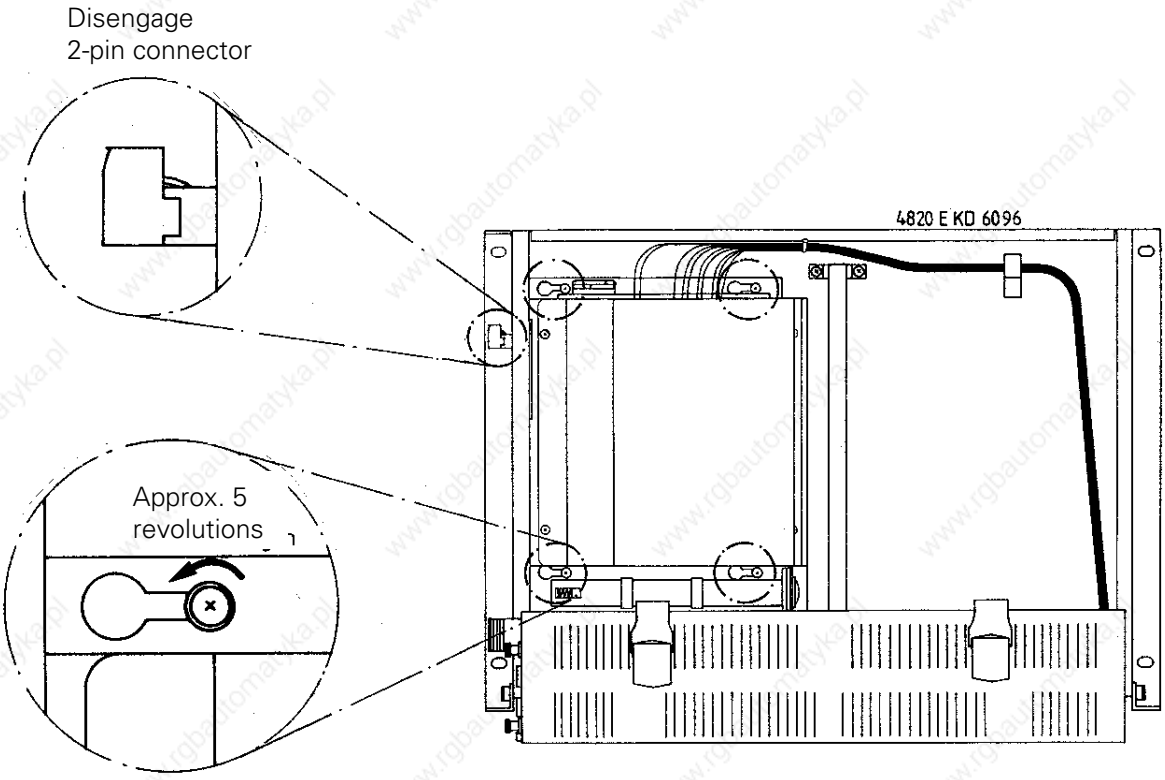


e) Pull the cable harness to the power supply through the housing.

To pull the cable harness the PLC graphics board and the CLP board must be removed. (see sections 21.4 and 21.5)

f) Disengage the connector of the NC power supply and loosen the mounting screws.





Slide out the power supply unit to the right and insert the new power supply unit.

g) • Fasten the mounting screws.
• Pull the cable harness through the housing again.
• Engage the connectors.
• Close the logic unit, switch on the main switch.

Exchange is now finished.

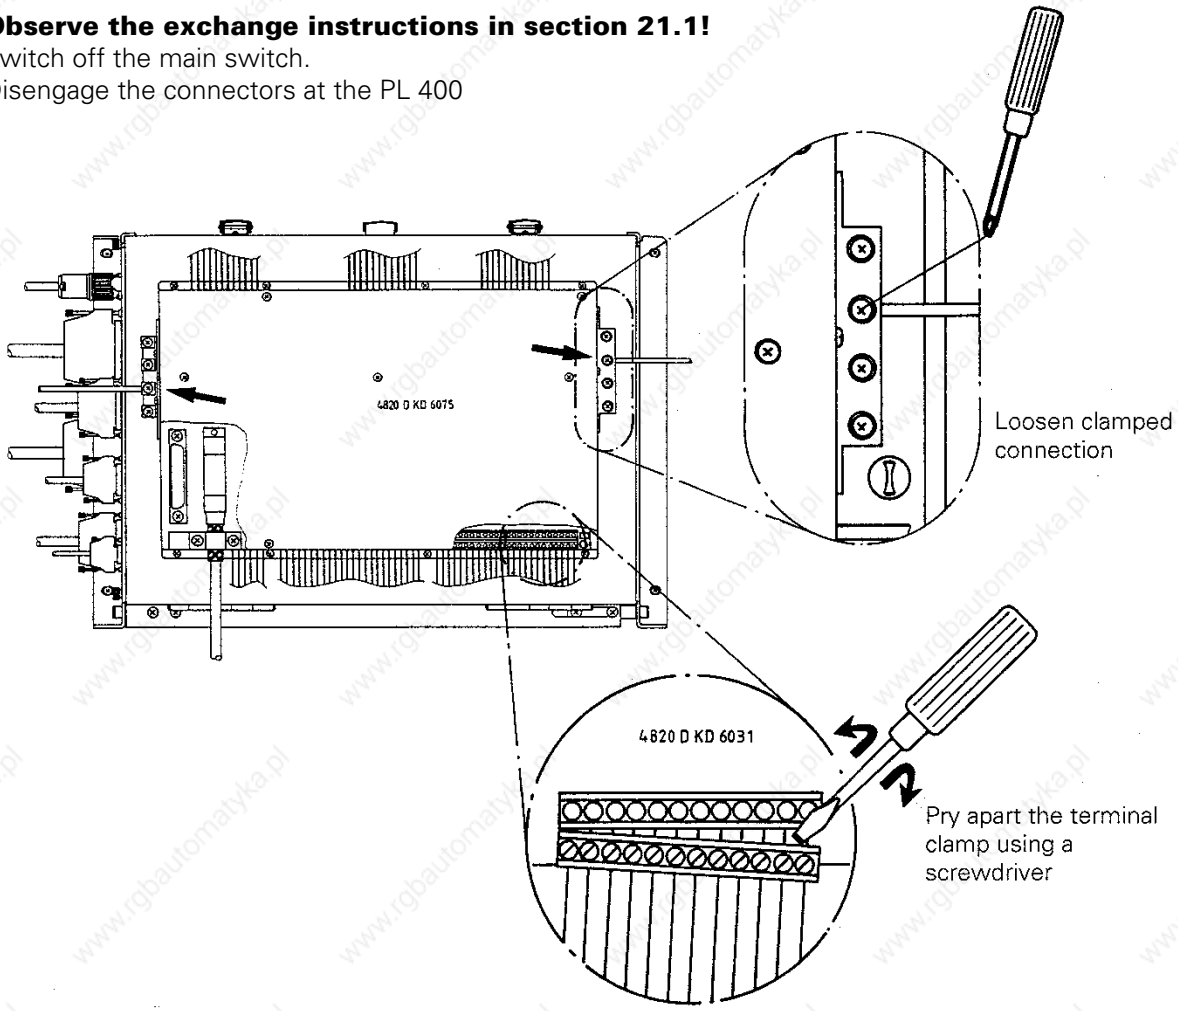
Observe that no connectors are switched!

Warning!
Send and store the boards **only** in the **original packaging material** that protects them from acquiring static charge. Never use conventional plastics to wrap the boards in.

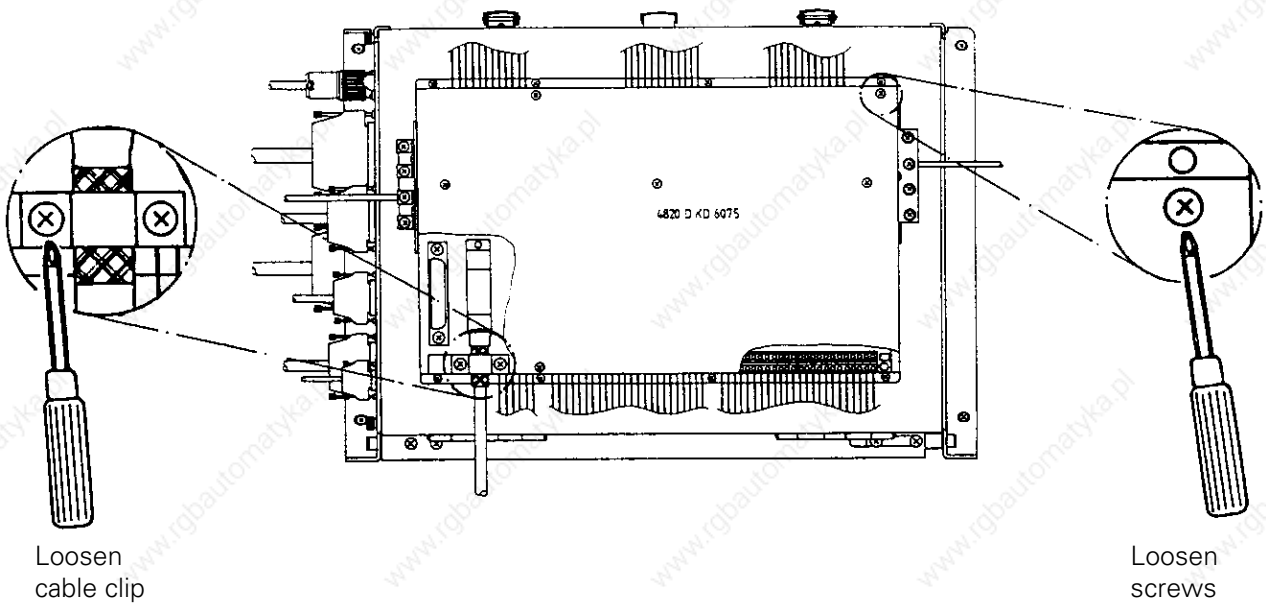
21.7 Exchanging the PLC I/O Boards

21.7.1 Exchanging the PLC I/O Board PL 400

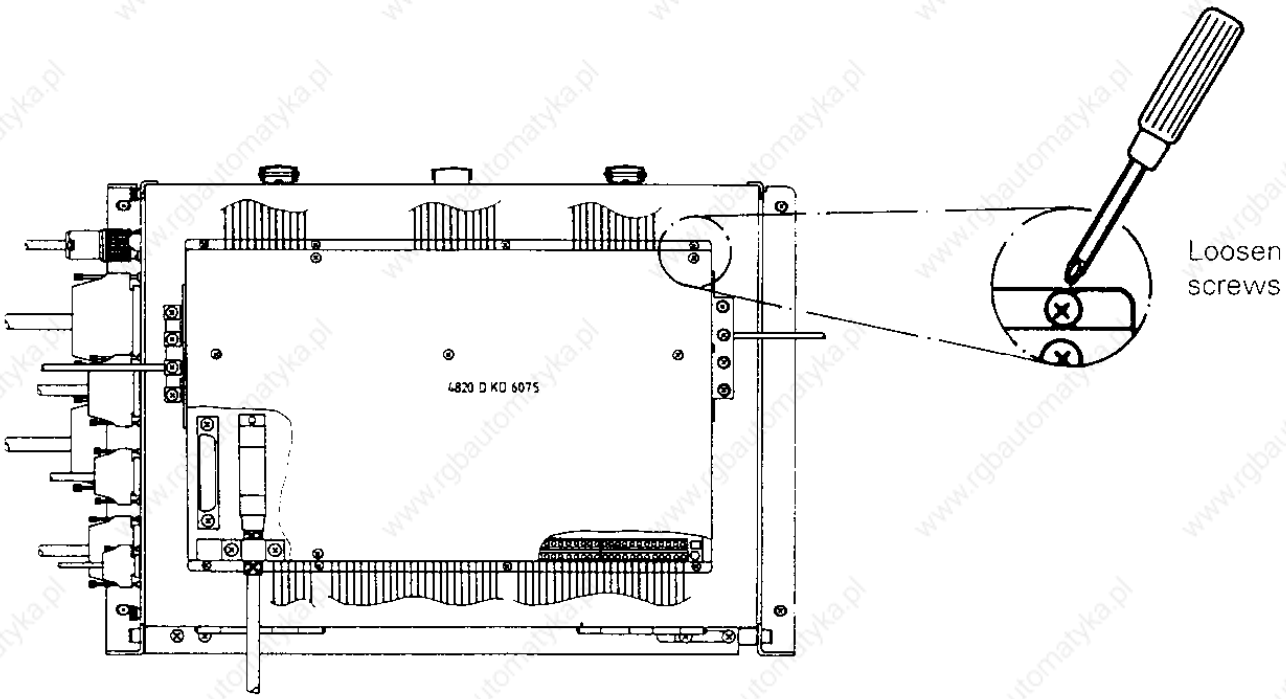
a) Observe the exchange instructions in section 21.1!
b) Switch off the main switch.
c) Disengage the connectors at the PL 400



d) Unscrew the cover of the PL 400 and disconnect the cable to the PLC graphics board from the PL 400.



e) Unscrew the PL 400 from the logic unit. [1)]



f) The new PLC I/O board PL 400 is mounted in reverse order:
- Mount the PL 400 to the logic unit. [1)]
- Engage the connectors.
- Switch on the main switch.

Exchange is now finished.

Warning!
Send and store the boards **only** in the **original packaging material** that protects them from acquiring static charge. Never use conventional plastics to wrap the boards in.

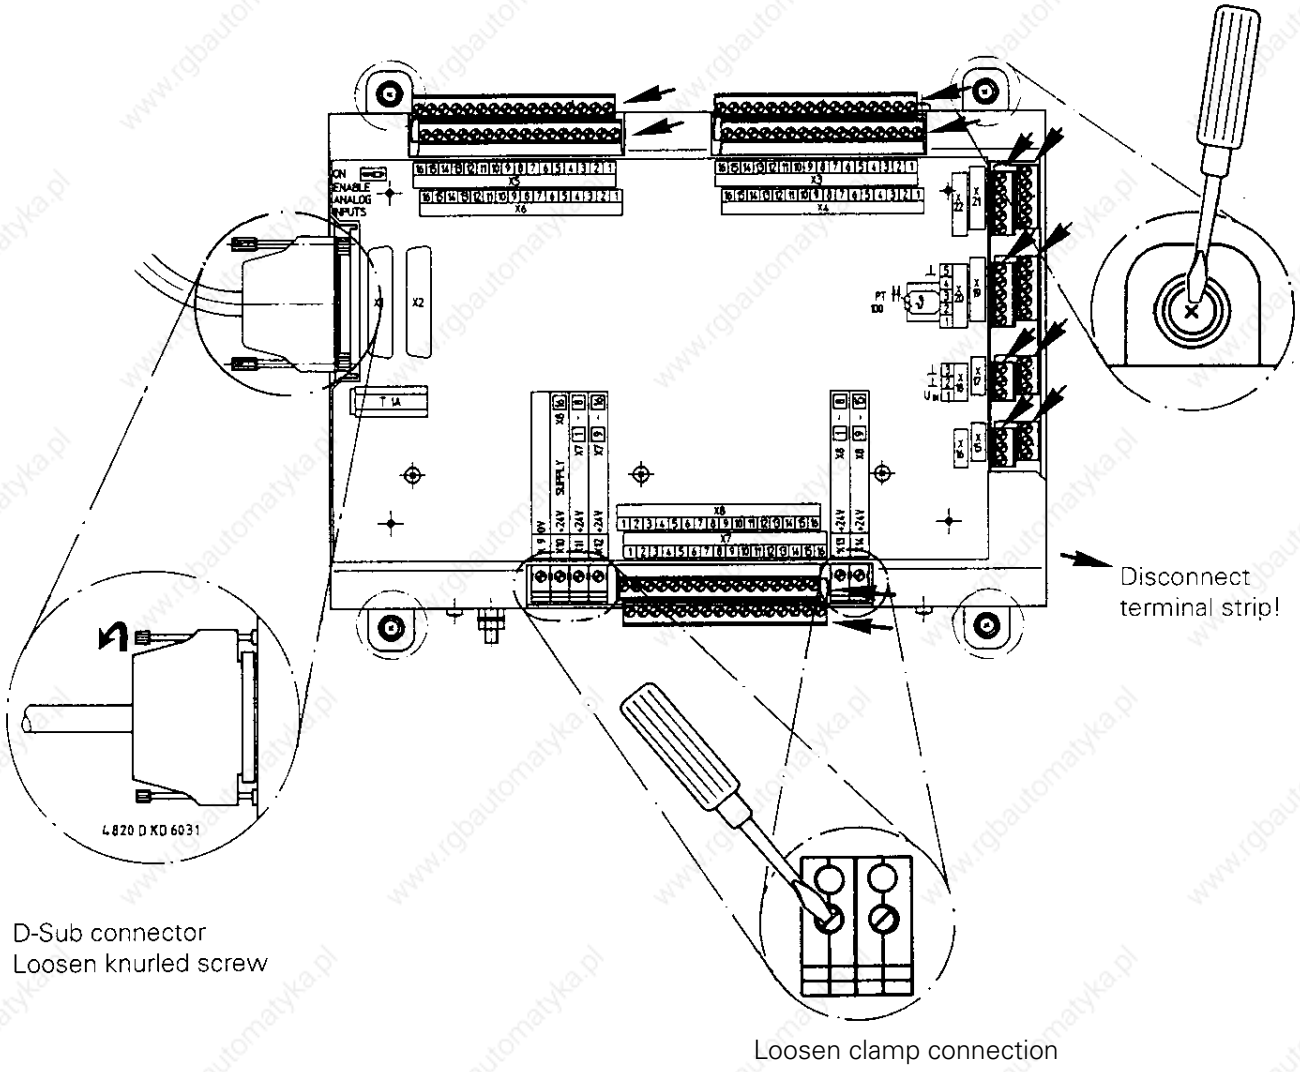
[1)] The PL 400 may also be located in the switch cabinet.

21.7.2 Exchanging the PLC I/O Board PL 410

a) Observe the exchange instructions in section 21.1!

b) Switch off the main switch.

c) Loosen the connectors at the PL 410.



d) Loosen the PL 410 mounting screws

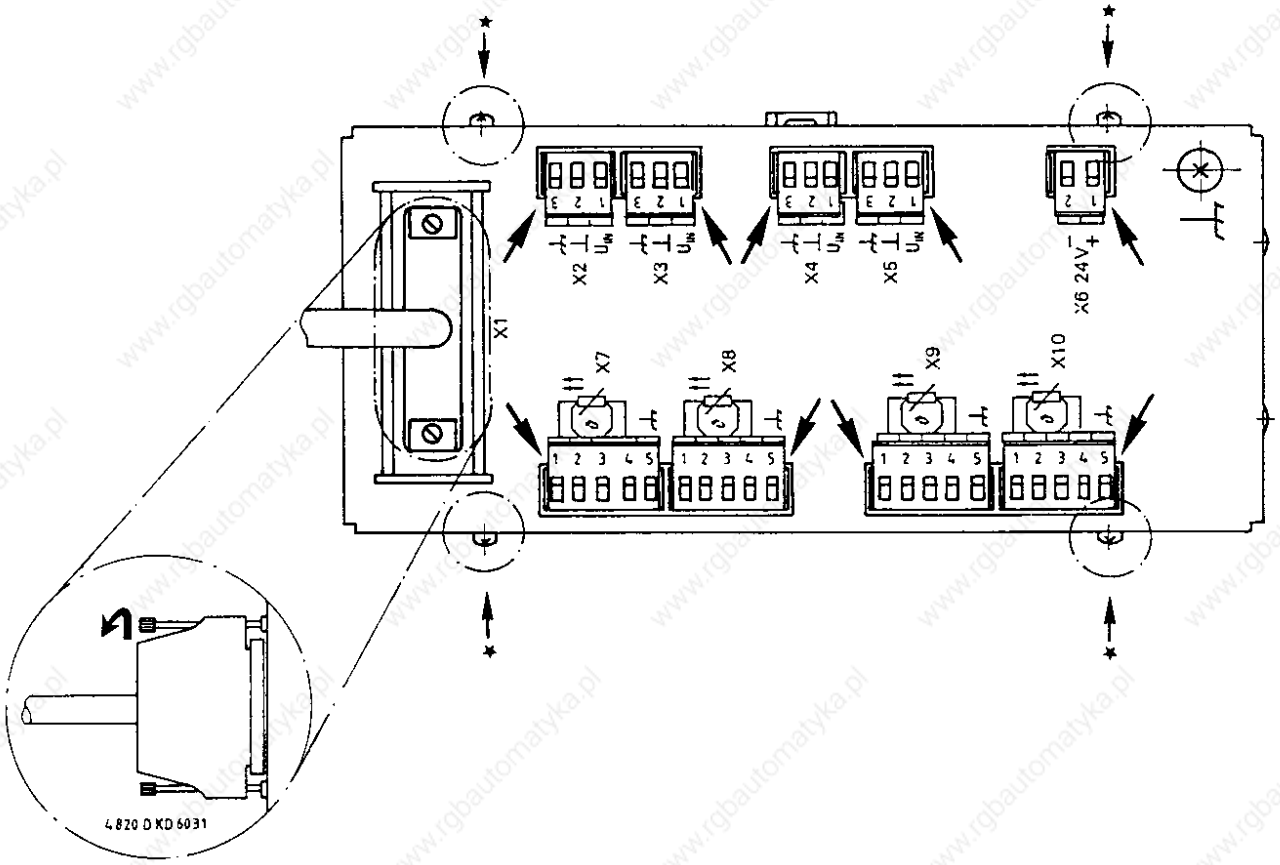
e) The new PLC I/O board PL 410 is mounted in reverse order:
- Engage all connectors.
- Check the correct position of the switch ENABLE ANALOGUE INPUTS. (ON position: analogue part activated, other position: analogue part not activated)
- Switch on the main switch.

Exchange is now finished.

Warning!
Send and store the boards **only** in the **original packaging material** that protects them from acquiring static charge. Never use conventional plastics to wrap the boards in.

21.7.3 Exchanging the Analogue Board PA 110

a) Observe the exchange instructions in section 21.1!
b) Switch off the main switch.
c) Disengage the connectors at the PA 110.



→ Disconnect terminal strip!

D-Sub connector
Loosen knurled screw

d) Dismounting the PA 110
The PA 110 may be fixed in two ways:
1) via fixing bar
Dismounting: Use a screwdriver to pry the lock upwards and remove the PA 110 from the bar.
2) via four mounting screws:
Dismounting:
- Loosen the mounting screws in the housing (∗ →)
- Unscrew the base plate and reassemble the PA for shipping.

e) The new PA 110 is mounted in reverse order:
- Engage the connectors.
- Switch on the main switch.

Exchange is now finished.

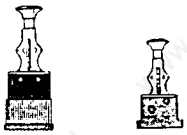
Warning!
Send and store the boards **only** in the **original packaging material** that protects them from acquiring static charge. Never use conventional plastics to wrap the boards in.

21.8 Exchanging the EPROMs

21.8.1 MOS Protection

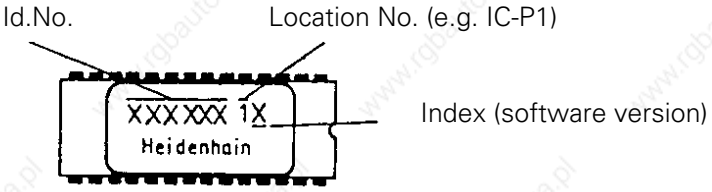
To exchange the EPROMs MOS protection is indispensable, as otherwise the EPROMs could be destroyed by static charge.

e.g. IC drawing punch and insertion tool

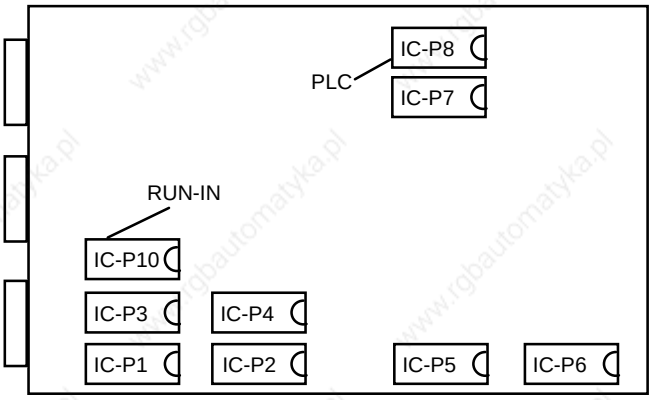


Observe the mark on the EPROMs (do not turn them by 180°); be sure not to damage any components during the exchanged. Use an appropriate tool. After the software exchange the logic unit must be marked with the new NC-software number (see sections 5.1 and 5.2).

21.8.2 EPROM Designation



PROCESSOR Board Id.No. 268 553 01

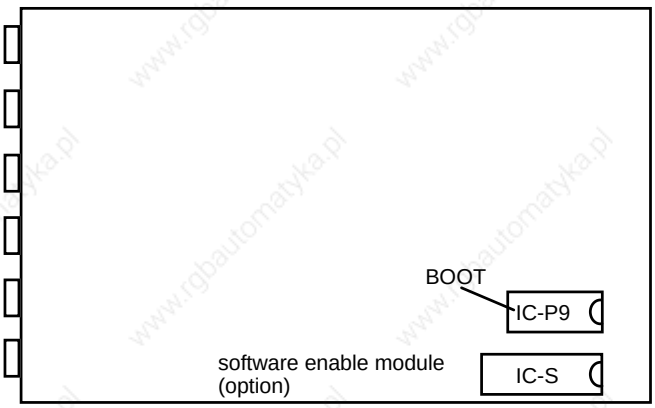


Note:

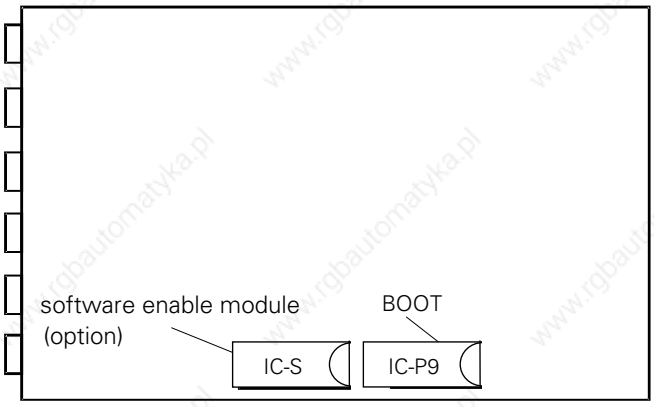
With the current software version IC-P3 / IC-P4 are not inserted.

RUN-IN: Internal test program (does not have to be exchanged together with the software)

CLP Board Id.No. 275 711 –
Id.No. 275 705 –



CLP Board Id.No. 268 927 –
Id.No. 265 401 --



22. Machine Parameter List

MACHINE PARAMETER LIST

(Excerpt from R.H. 1.0 TNC 415B/425, sections 5.1 and 5.2)

Code Numbers

123	MACHINE PARAMETER EDITING FOR END USERS (marked by *)
75368	OFFSET ADJUSTMENT
79513	VOLTAGE AND TEMPERATURE DISPLAY
86357	REMOVE EDIT/ERASE PROTECTION
95148	MP MODE
105296	COMPENSATION VALUE LIST
531210	RESET M 1000 TO M 2000 AND BYTES 0 - 127
620159	DOWNLOAD RUN-IN PROGRAM VIA INTERFACE
807667	PLC MODE
688379	INTERNAL OSCILLOSCOPE
951026	START RUN-IN PROGRAM FROM EPROM

Machine Parameters

In the following list the machine parameters for all software versions are listed.
Since however, certain machine parameters are only valid for a certain software version, or are only active from a certain software version on, columns with symbols for differentiation have been introduced after the machine parameter number.

Explanation of the Symbols:

◆ = The machine parameter applies for all software versions of this control.
04 = The machine parameter has been introduced with a certain software version (e.g. 04 means: introduced with software version 04).
I04 = The machine parameter is inactive.
- = The machine parameter is not available with this control.

Explanation of the Columns:

A = TNC 415B/F/BR/FR and TNC 425/E with NC software 259 93* -- or 259 94*
B = TNC 415B/F/BR/FR and TNC 425/E with NC software 280 54* -- or 280 56* -- (special software)
C = reserved
AE6 = entry values for operation with HEIDENHAIN test unit

User Parameters

By means of the MOD function "User Parameters" certain machine parameters can be altered easily (e.g. adaptation of the data interface). The user parameters that are accessible via this MOD function are determined in machine parameters by the machine tool manufacturer.

Input Values

Input values are e.g.

- the numbers 0 and 1 to select functions, algebraic signs or the counting direction
  or
- numerical values for feed rates, displacement etc.
- decimal input values that can be calculated by combining several functions (bit-coded)
- bit patterns (selectable with %)
  e.g. MP 10 : % 00111
  i.e. X,Y,Z with encoder (1)
  IV, V without encoder (0)
- hexadecimal values (selectable with $)
  e.g. MP 7353.0: $ 0F818A0

Structure

The machine parameters are subdivided into groups.
The parameter numbers are structured such that the list can be expanded easily.

0-999	Encoders and machine tool axes: allocation, evaluation, compensation
1000	Positioning
1400	Operation with feed precontrol
1700	Operation with servo lag
1900	Integral digital speed control (TNC 425)
2000	Integral speed and current control (TNC 426 PA)
3000	Spindle
4000	Integral PLC
5000	Adaptation of the data interface
6000	3D-touch probe (general parameters)
6200	Connection of measuring touch probe or touch trigger probe
6210	Digitizing with 3D-touch probe
6500	Tool calibration with TT 110
7100	Tapping
7200	Display and programming
7330	User parameters
7350	Colours, general display and FK graphics
7400	Operation and program run
7500	Tilting the working plane
7600	Hardware

Cams for "Reference End Position":
The reference marks can either be traversed manually using the axis direction keys or automatically with the start key. It is not necessary to enter a code number for the manual traverse as was the case with preceding TNC models. The traverse direction for automatic traverse of the reference marks is defined in MP1320. In order to reverse the traverse direction at the end of the traverse range, a cam for "reference end position" is required. The trigger signals "ref. end position" are assigned to free PLC inputs. By the PLC software these PLC inputs are connected to the PLC markers M2506 and M2556 to M25599. Depending on the entry value of MP1350 the TNC behaves differently.

Linear Encoder with Distance-Coded Reference Marks (MP 1350.X = 0), Mode 1
If the trigger signal "ref. end position" is set when starting reference mark traverse, the axis moves in the direction opposite to that set in the MP1320. If the trigger signal "ref. end position" is only set during automatic traverse, the TNC ignores this signal. Thus, there must be at least two reference marks within the range of the "reference end position". Ref. mark evaluation takes place either in the range of the "ref. end position" or else beyond this range. In case of an evaluation beyond the software limit switch range, the axis automatically moves to the software limit switch after evaluation.

Linear Encoder without Distance-Coded Reference Marks (MP 1350.X = 1)
The traverse direction is automatically reversed, if the axis traverses the cam for "ref. end position". If the axis is already in the range of the "reference end position" range when starting, it moves immediately in the opposite direction. For this reason the reference mark has to be outside the "ref. end position" range.

Special Operation: Linear Measurement with a Rotary Encoder (MP1350.X = 2)
The axis automatically moves to the cam for "reference end position" at the defined feed rate (MP1330). This axis is started again at a reduced feed rate (MP1331) in the opposite direction; the first reference mark is evaluated after the end of the "reference end position" range has been reached. Then the axis is stopped. If the axis is already in the "reference end position" range when starting, it moves immediately at the reduced feed rate (MP1331) in the direction opposite to that indicated in MP1320.

Linear Encoder with Distance-Coded Reference Marks (MP1350.X = 3), Mode 2
If the trigger signal "reference end position" is set during reference mark traverse, the axis moves opposite to the direction defined in MP1320. The signal "ref. end position" is not ignored by the NC. it is only set during automatic traverse. The traverse direction is reversed immediately. Thus, no reference marks are required in the "ref. end position" range.
