

Berger Lahr positioning drives

## Berger Lahr positioning drives

### General information

The selection of positioning drives was previously limited to either a servomotor drive or a stepping-motor drive. Both of these distinct drive technologies have been combined in the Twin Line product family, enabling you to match the advantages of each system to your particular application.

Three different motor series are available for the Twin Line positioning drives:

### 3-phase stepping motors

Exceptionally robust, maintenance-free drives. They execute precise, step-by-step movements specified by a positioning controller.

The 3-phase stepping motors can be operated in conjunction with Twin Line power electronics (Power range from 350 W to 750 W) at resolutions from 200 to 1000 steps per revolution or, in micro-step mode, from 2000 to 10000 steps per revolution.

Options such as rotation monitoring, holding brake and rugged, low-backlash planetary gears expand the application possibilities.

### AC synchronous servomotors - standard

Provide a very high power intensity, enabling highly dynamic positioning drives offering exceptional performance at a low price.

Power range from 750 W to 3 kW.

### AC synchronous servomotors - high performance

Offer high impulse torques and a large power bandwidth, making them easy to adapt to your application.

Power range from 750 W to 8 kW.

Berger Lahr servomotors are compatible with standard servo connection dimensions, providing flexible solutions to any problem. They all come equipped with an absolute measuring system, the SinCos® (SRS) Singleturn. This measuring system is designed to provide optimum performance with our Twin Line family of devices. You can use the HIPERFACE® interface between motor measuring system and device for a self-initialisation of the motor and current-regulator parameters, considerably simplifying the start-up process.

An AC synchronous servomotor module consists of the AC synchronous servomotor itself and the associated controller. Optimum performance is achieved only when motor and controller are perfectly in tune with each other.

Ever more exacting demands are being placed on the applications of modern drive technology, including:

- Positioning precision
- Rotary-speed precision
- Torque precision
- Regulation range
- Dynamics
- Overload compatibility
- Availability

These demands are fully satisfied by the Berger Lahr family of Twin Line products and by both AC synchronous servomotor programs: Standard and High Performance.

# AC synchronous servomotors - High Performance

General

Series of High Performance AC synchronous servomotors

## AC synchronous servomotors - High Performance

### Features

- **High impulse torque** up to five times the continuous stationary torque.
- **Large power bandwidth** encompassing a continuous stationary torque range from 0.34 to 50 Nm, in six model sizes.
- **High adaptability** to your application, because of the availability of individual sizes in several speed/torque variants.

### Technical specifications

- 6-pin synchronous motors
- SinCos absolute measuring system® (SRS) Singleturn as standard position and rotary-speed measuring system, except for DSM 4-05.x, which only comes with the Resolver
- Use of high-energy neodymium-iron-boron magnets
- Integrated thermal efficiency monitoring (NTC)
- Vibration severity level R according to DIN ISO 2373
- Protection type:
  - Motor housing: IP 65
  - Shaft end, front: IP 64
- Motor and measuring-system connection with mounting sockets, straight exit, except DSM 4-19x, motor connection only via terminal box
- Size (flange)
  - DSM 4-05 (55 x 55 mm<sup>2</sup>)
  - DSM 4-07 (70 x 70 mm<sup>2</sup>)
  - DSM 4-09 (92 x 92 mm<sup>2</sup>)
  - DSM 4-11 (110 x 110 mm<sup>2</sup>)
  - DSM 4-14 (140 x 140 mm<sup>2</sup>)
  - DSM 4-19 (190 x 190 mm<sup>2</sup>)
- Rated speeds, depending on motor length
  - DSM 4-05: 6000 min<sup>-1</sup>
  - DSM 4-07: 4000/6000 min<sup>-1</sup>

- DSM 4-09: 3000/4000/6000 min<sup>-1</sup>
- DSM 4-11: 3000/4000/6000 min<sup>-1</sup>
- DSM 4-14: 2000/3000/4000 min<sup>-1</sup>
- DSM 4-19: 1500/2000/3000/4000 min<sup>-1</sup>

### Optional accessories

- Measuring system
  - SinCos® (SRM) Multiturn
  - Resolver only for DSM 4-05.x
- Integrated holding brake
- Gearbox
- Mounting sockets, 90°, can be rotated for:
  - Motor (except DSM 4-19.x)
  - Measuring system
  - Special shaft, special flange
  - Vibration severity level S
  - Level R flange precision
  - Different colour scheme

### Environmental influences

Ambient conditions (based on DIN 50019-R14):

- Temperature: -20 °C to +40 °C
- Humidity: 75 % R.H. yearly average, 95 % R.H. on 30 days, non-condensing

Storage and transport temperature:

- Temperature: -20 °C to +60 °C

## Holding brake

The holding brake is an electromagnetic spring-pressure brake for locking the motor axle after the motor current is shut off. In emergency situations, such as in a power failure or during an EMERGENCY STOP, it shuts down the drive, significantly contributing to overall safety. The motor axle must also be locked for weight-induced torque loads, e.g. in cases of vertical axes in manual mode.

### Holding brake controller

The holding brake is controlled via the **Twin Line Holding Brake Controller**, which is available as an accessory.

#### **Caution! Overloading may damage the holding brake!**

Avoid stationary load torques greater than 25 % of the motor holding torque when using vertical axes with the holding brake.

### Technical data of the holding brake for DSM motors

## Measuring systems

The standard measuring system is the SinCos® (SRS) Singleturn. This measuring system is designed to provide optimum performance with our Twin Line family of controllers. You can use the HIPERFACE® interface between motor-measuring system and device for a self-initialisation of the motor and current-regulator parameters, considerably simplifying the start-up process.

The SinCos® (SRM) Multiturn and Resolver, 2-pin, are optionally available.
