## Article no. BWU2173

The stainless steel AS-i Safety Monitor controls the outputs of the AS-i Safety Output Module by using a safety AS-i single address. To set the safety AS-i address, the dip-switch has to be in the ON/PRG position. Addressing can then be accomplished by using an AS-i addressing device, for example. Several AS-i Safety Output Modules can have the same safety address and can be controlled via this same safety address on a AS-i circuit. All AS-i Safety Output Modules with the same safety address are controlled simultaneously. In addition to the safety single address the module also supports an AB-address used to transmit the states of the standard inputs or of the electronic device monitoring (EDM). Another AB slave is available for diagnostic.
