

Autopad Linear Position Sensor

Features:

- Absolute non-contact inductive position technology
- Passive target
- Senses through non-conductive materials and fluids (e.g. plastic, glass, oil, water)
- Custom ASIC provides 12bit resolution
- Analogue 0-5V or 4-20mA output
- Fast response time
- Linear travel: 75mm, 150mm, 250mm
- OEM versions available customised to the requirements of your application

Our advantage:

- No contact between target and sensor so parts cannot wear out
- Simple and robust construction with proven reliability; >40million Autopad sensors in the field
- Excellent immunity to external electromagnetic fields
- Completely immune to magnetic fields
- Immune to dirt and dust
- Good tolerance to geometric offsets
- Cost competitive performance

Application

- General sensing applications, especially where:
 - Reliability and ease of use are important
 - Large magnetic fields and/or harsh EMC requirements (e.g. near motors)
 - High vibration environments (e.g. pumps, heavy machinery)
 - Wet and/or dirty environments
- For example, industrial automation, process control, valve positioning, materials handling, injection moulding, cutting & slitting, welding, CNC machines, hydraulic cylinders, robotics

Output

Technology

- Originally developed for demanding automotive applications, Autopad is an inductive technology which is now available for use in industrial applications.
- The key components are a sensor element (or Pad), a target (or Puck) and electronics, based around a proprietary ASIC.
- The Pad includes two PCB track structures which each form transmitter coils. These generate sine and cosine shaped spatial electromagnetic fields.
- The moving target is formed by a simple LC resonant circuit - the Puck.
- The transmitter coils are driven with a high frequency carrier (at the Puck resonant frequency), but modulated at a lower frequency in quadrature. These fields couple to the Puck and the cumulative current generated in the Puck depends on its position.
- The alternating field produced by the Puck induces a voltage in a third coil on the Pad — the receiver coil. The ASIC synchronously detects this voltage signal, leaving only the modulated signal. The phase of this modulated signal is then calculated and gives a direct measurement of the Puck position.
- The technology can be configured for specific applications – for example, to suit a specific geometry, or with a high resolution and accuracy coarse/fine output, or with redundant output for increased reliability.

Specification

Interface	Analogue: 0-5V ratiometric	Analogue: 0-5V	4-20mA
Power supply	4.5 – 5.5V DC	7-25V DC	24V
Current consumption	20 mA	15 mA (24V)	40 mA
Sensing Range (L)	75mm / 150mm / 250mm		
Nominal target–sensor separation	2mm +/- 1.5mm		
Sense through nonconductive material (eg: plastic, water, oil)	Yes		
Linearity	1% full scale output		
Hysteresis	None		
Magnetic field resistance	Complete Immunity		
Resolution	12 bit		
Update rate	250µs		
Operating Temperature	-20 to 85°C		
Storage temperature	-40 to 125°C		
Electrical connections	Brown: V+, Black: Output, Blue: Gnd		
Output load	>1kΩ		
Reverse polarity	Yes		
Overvoltage protection	Yes, to 40 V		
Cable length	0.5m		
Sealing	IP67		
Approvals	CE, ROHS & WEEE		

General Note
