

4-4 Timing Chart

【Modes】

- 1) Sleep Mode : When the output is OFF. The electrical current consumption is around 1 μ A.
- 2) Standby Mode : After the sensor's output reached ON status, the sensor switches to standby mode. The electrical current consumption gets close to 1.9 μ A . When the sensor's output returns to its OFF value after expiration of the "hold time", the sensor switches again to sleep mode.
- 3) Mask Mode : Time during which the output is forced to OFF after the end of the standby mode. (no detection is possible during this period.)

【Durations】

- $t_1(T_{wu})$: Circuit Stability Time: About 25s. (typ.)
 During this stage, the output's status is undefined (ON/OFF) and detection is therefore not guaranteed.
- t_2 : Standby Hold Time: About 2.6s (typ.)
 Depending on the number of output happening during standby mode, the hold time can differ ($\times 1$)
- t_3 : Mask Time About 1.3s (typ.)
 During this stage, even if the sensor detects something, output will not switch to ON. ($\times 2$)

Specifications

Ver.1.1

Product Name

PIR MOTION SENSOR "PaPIRs"

Model No.

EKMB119111 □

Page: 4

4-5 Detection Area
