OVERVIEW

These split-core current transducers are designed for energy management with a convenient connection to electronic sub-metering. They may also be applied for current measurement in a system of distributed power line carriers (PLCs) or remote controls such as SCADA software for automation and supervision. Other applications include security and condition monitoring, load monitoring, protection systems, and predictive maintenance of conveyors, pumps, HVAC motors and more.

LOAD TREND MONITOR PER DISTRIBUTION PANEL

When a sensor outputting analog instrumentation signals in proportion to load current, is clamped directly onto the main or branch wiring of the distribution panel, direct input into analog port as PLC or data logger becomes available without a converter in the middle.
